P R O C E E D I N G S

**Introductory Remarks**

MS. SHOWALTER: We are going to go ahead and get started. My name is Janet Showalter. I am the ICH Coordinator for FDA. We have a number of presentations to go through for you. This is a preparation meeting for the Brussels meeting. It is something we do prior to every ICH meeting as a matter of transparency and also to let you know exactly what we are planning to do once we get there so that we can get your input so that can use that as we negotiate in Brussels.

The session is being recorded. There is going to be a transcript available. I believe that will be made available on the website following the meeting. Again, since there are not very many of us here this morning, I would like us to be informal. I think you are invited to ask questions as we go or you can hold them until the end for the presentations.

One of the things that we do prior to starting this every time, and this may be old-hat for a lot of you, we do like to go through and give a brief overview of ICH and the process, what it is all about.

1           This morning Christelle Anquez of my staff  
2 in the Office of International Programs is going to  
3 provide that presentation so I think we will try to  
4 sort of zip through some things so that we make  
5 sure we get to your questions.

6           Christelle?

7                           **ICH General Overview**

8           MS. ANQUEZ: Good morning, everyone. I  
9 will get started and then you will have the slides  
10 on the screen. I will go rapidly because I am sure  
11 you are very familiar with ICH and this is very  
12 basic.

13           So ICH stands for International Conference  
14 on Harmonization of Technical Requirements for the  
15 Registration of Pharmaceuticals for Human Use. It  
16 is a unique approach. It comes from the agreement  
17 between the European Union, Japan and the USA to  
18 take action on Harmonization. It is a joint  
19 initiative involving regulators and industry as  
20 equal partners in technical discussions.

21           ICH Guidelines are developed to harmonize  
22 the technology requirements that must be met for  
23 regulatory submissions in the EU, Japan and U.S.  
24 ICH was created in 1990 at a meeting hosted by the  
25 European Federation of Pharmaceutical Industries

1 and Associations located in Brussels.  
2 Representatives from industry and regulatory  
3 authorities met to plan for the ICH conference. At  
4 the beginning, it was just to be one conference and  
5 it led to thirteen years of work. It also  
6 established the terms of reference and the method  
7 of working.

8           The ICH objectives are the identification  
9 and elimination of the need to duplicate studies,  
10 to meet different regulatory requirements. This  
11 leads to a more efficient use of resources, human,  
12 animal, material, in the R&D process as a  
13 consequence. The bottom line is quicker access to  
14 patients of safe and effective new medicines.

15           Since the focus of ICH has been on the ICH  
16 has been on the technical requirements for  
17 medicinal products containing new drugs and because  
18 the majority of these new drugs and medicines are  
19 developed in the Western European Union, in Western  
20 Europe, Japan and the U.S., when ICH was  
21 established, it was agreed that its scope would be  
22 confined to registration in these three regions.

23           These are the six founding members of ICH.  
24 EU was this European Commission, EMEA; EFPIA, the  
25 Ministry of Health, Labor and Welfare, Japanese

1 Pharmaceutical Manufacturers Association, the FDA  
2 and PhRMA.

3 ICH is administered by the ICH Steering  
4 Committee which is supported by the ICH  
5 Secretariat. IFPMA is located in Geneva and  
6 provides the Secretariat to participate as a  
7 non-party member of this joint committee. The  
8 second part of ICH is the technical part where the  
9 science and technology occurs within the expert  
10 working group.

11 On the steering committee, there are two  
12 members per party and a coordinator is the IFPMA,  
13 which is a non-voting member, and three observers,  
14 one for Canada, EFTA--the European Free Trade  
15 Area--and WHO. The role of the steering committee  
16 is to oversee and monitor the Harmonization  
17 process.

18 The ICH topics are divided into four  
19 categories; safety that relates to preclinical  
20 studies. Efficacy relates to clinical studies.  
21 Quality and the last category is regulatory  
22 communications. That include MedDRA and other  
23 electronic items.

24 The guidances are posted for each region  
25 and, for the U.S., it is posted on the CDER and

1    CBER website. The steering committee has outlined  
2    the ICH for monitoring the process of harmonization  
3    work. Step 1 is the expert working group are  
4    building scientific consensus. The draft document,  
5    when it is agreed upon, it goes to the steering  
6    committee. The steering committee approves it by  
7    signing off on it and then it is released on the  
8    three regions for publication and comments.

9            The comments are brought back by the  
10   regulatory authorities to the working group. They  
11   are discussed. The draft is revised if necessary,  
12   agreed upon and then, if the steering committee  
13   agrees with it, it is signed off. The regulators  
14   sign off on it. The last step, Step 5, the  
15   document, the guidance, is implemented in the three  
16   regions.

17            ICH also organizes a final conference to  
18   present the work done for open and public  
19   discussion. The first conference was in Brussels  
20   in 1991. The second conference was in Orlando in  
21   1993. The third conference was in Yokohama in  
22   1995, then in Brussels in 1997. The fifth one was  
23   in San Diego in 2000 when the CTD got signed off.  
24   The sixth conference to come will be in Osaka in  
25   2003.

1 Thank you.

2 MS. SHOWALTER: Thank you, Christelle.

3 I am going to do the next presentation on  
4 the agenda which is one of the big items of  
5 discussion for the upcoming Brussels meeting is  
6 going to be the GMP Program for the 21st Century.

7 **GMPs**

8 MS. SHOWALTER: The way we are going to do  
9 the meeting today, we are going to go through some  
10 of the big topics for the Brussels meeting. One of  
11 the big items on the agenda is actually the ICH  
12 portion of the GMP Program, the Drug Product  
13 Quality, or GMP, Program for the 21st Century.

14 What I want to do today is give you some  
15 idea of the work that we have done to prepare for  
16 this meeting and give you an idea of the kinds of  
17 things that we are going to be talking about in  
18 Brussels.

19 First of all, I want to let you know the  
20 people that are on this committee, this is the  
21 International Working Group for the GMP Initiative.  
22 It probably helps to put this in context a little  
23 if you understand that that there are more than  
24 fourteen groups. I say more than fourteen because  
25 it grows kind of by leaps and bounds all time and I

1 think several have been added.

2           When we started this, there were fourteen  
3 working groups. The international group is one of  
4 those fourteen. This just gives you some idea of  
5 the magnitude of the initiative because you look at  
6 the long list of names that are participating in  
7 the international section. On all of the various  
8 committees, there is a list equally as long and, in  
9 fact, some people are participating on more than  
10 one.

11           So I think it gives you some idea of the  
12 priority and the extent to which this is going to  
13 make a huge change in FDA.

14           When we decided to take the GMP Initiative  
15 up in ICH, we had some concerns about whether ICH  
16 would be an appropriate venue for this. As we  
17 went, we reflected on some of the kinds of topics  
18 that we had taken in the past to ICH and we  
19 realized that there were some similarities with  
20 other topics in terms of the process that we might  
21 use for this one.

22           So we are doing kind of a "lessons  
23 learned" from what we have done with gene therapy  
24 and also with pharmacovigilance. The process we  
25 used for those was to really get a discussion going

1 of the technical experts that we had already within  
2 the ICH framework and then pull in some  
3 opportunities for outside expertise as well, and to  
4 also make sure that, before we embarked upon a  
5 single topic, that we really had a good  
6 understanding of the lay of the land in the area.

7           So I really want to give you concept today  
8 that we are not really jumping very smartly on this  
9 but we are taking our time to stop and reflect and  
10 deliberate so that we can end up with a good and  
11 timely product.

12           Another topic that we also reflected on  
13 was the work that we had done with a previous GMP  
14 topic and that was on the Q7A topic, GMPs for APIs.  
15 We thought there would also be a number of lessons  
16 learned from this as well. In fact, we were  
17 looking at this topic because this is one where we  
18 had a great deal of success in accommodating our  
19 domestic time line even while making some serious  
20 steps forward internationally.

21           The way that we did this, we realized, was  
22 to have a concrete idea of exactly what we wanted  
23 to do and then start marching down a very  
24 well-specified pathway.

25           So, in working with my GMP international

1 group, what we set out to do was to identify two  
2 major areas where we thought we would play an  
3 important role. The desired outcome or the goal  
4 for this initiative was firstly to have harmonized  
5 international scientific standards. This would be  
6 done under the auspices of ICH.

7           When we looked at this topic, we really  
8 set our sites on standards for drug-product quality  
9 or GMPs that would promote technological  
10 innovation. Then we realized that that would not  
11 exactly get the entire job done but there would  
12 also need to be an additional goal. This was a  
13 more long-term plan for international regulatory  
14 cooperation and the end product for that would  
15 actually be an FDA concept paper that would outline  
16 the long-term plan for regulatory collaboration.

17           This has actually a much longer time line  
18 associated with it. That FDA concept paper will  
19 probably not be ready for another, I would say,  
20 eighteen months or so or at the moment when we  
21 actually revisit the GMP initiative.

22           So, in getting ready for this talk today,  
23 one of the things that I wanted to do, and I want  
24 to go through these fairly quickly, was to give you  
25 an idea of the buildup and how we are getting to

1 this point, this sort of critical moment in time  
2 that we are going to come to at the Brussels  
3 meeting.

4           As you can see from the next few slides  
5 that I put together, the international working  
6 group has actually met a about once a month. We  
7 have had some very good discussions, a lot of very  
8 important exchange, not with just the folks at CDER  
9 but also with our colleagues in vet medicine, in  
10 Biologics and ORA and the Office of Regulatory  
11 Affairs.

12           We started this process in August of last  
13 year. We had our first meeting. That is when we  
14 realized we would need to do an ICH concept paper,  
15 that we would need to have Janet Woodcock actually  
16 address the steering committee in September of that  
17 year at the Washington ICH meeting.

18           Following that, we did some additional  
19 brain storming in September after the meeting and  
20 realized that the first track would be a short-term  
21 deliverable. Basically, what we were told at the  
22 ICH meeting in Washington was that, if we wanted  
23 this topic to go forward in ICH, we would need to  
24 have something to our ICH partners by the end of  
25 November. I can tell you, this was no easy task

1 trying to get a single concept paper that everybody  
2 across many centers and ORA could agree on.

3 But we did meet our time line. Then we  
4 had some additional meetings to talk about what  
5 kind of document might accompany the concept paper.  
6 The concept paper is actually something that ICH  
7 requires before it takes up a topic. We realize  
8 that it was pretty sketchy at best in terms of what  
9 we knew last August or last September in trying to  
10 put this together.

11 We realized, at our October meeting on  
12 October 22, the need to put together what we call a  
13 white paper. The white paper actually is something  
14 that lays out the lay of the land, the current  
15 situation in FDA and what we wanted to get out of  
16 the overall GMP initiative and how this would  
17 relate to ICH.

18 Then we had a number of other meetings at  
19 the same time that we were proceeding down this  
20 track of doing the concept paper, the white paper  
21 and so forth. Also, the agency was trying to move  
22 forward with a number of contracts and getting  
23 those finalized.

24 At the early stage of that, we thought  
25 that there could be an international component to

1 those contracts but, as time wore on, we realized  
2 that probably wouldn't pan out. So our task became  
3 sort of in the fall through the winter to put  
4 together the white paper, to get that reviewed and  
5 vetted within the agency.

6           You will see we had meetings in November,  
7 more meetings on that in December, culminating in a  
8 February finalization of the white paper and also  
9 this dovetailed very nicely--some of you may have  
10 attended the April GMP workshop here in Washington.  
11 One of the things that we were trying to do is to  
12 get all of this great load of information that the  
13 various working groups have and figure out how we  
14 can coalesce that into sort of a unified program.

15           This did come together at the April  
16 workshop. We heard a lot about what the  
17 international component of the GMP programs should  
18 be. There were many, many references to  
19 harmonization. This made us very happy the fact  
20 that we had early on decided to, at a minimum, take  
21 this to ICH and, perhaps, later on to other venues.

22           One of the other venues that you will find  
23 repeatedly gets mentioned, and we had a discussion  
24 of this at our February meeting, is the PIC/s.  
25 That is something that we are currently

1 investigating as a venue for further regulatory  
2 collaboration on this topic.

3           We had additional meetings in March of  
4 this year. We also, at that point, got an update  
5 from our folks in FDA that we are working on the  
6 contract process. This is when the international  
7 component was actually deleted. However, there is  
8 still interest in soliciting some information from  
9 other countries. Some of those that we have set  
10 our sites upon for various reasons are Japan,  
11 because we work closely with them and they are a  
12 market leader in the pharmaceutical area. Also,  
13 there seems to be some potential for lessons  
14 learned with Switzerland, Canada and Australia. We  
15 understand that Australia has recently made some  
16 changes to more or less align themselves with the  
17 PIC/s scheme.

18           There have been some additional meetings  
19 and discussion in May. At this point, we were  
20 finalizing our action plan and I believe that the  
21 long-term deliverable of investigating other venues  
22 was also approved by the GMP steering committee.

23           So now, as we are really sort of on the  
24 brink of Brussels meeting, what we have been doing  
25 is meeting with the international working group and

1 also with team that is going to ICH to negotiate  
2 this topic. We have really refined our thinking a  
3 lot since when we embarked upon this last August.  
4 I think it is worth noting that some of the topics  
5 that repeatedly come up as contenders for some sort  
6 of harmonization are things like general  
7 definitions for risk and quality, process  
8 capability, pharmaceutical development and also  
9 variations and changes.

10           One of the things that also we set our  
11 sites on in June was the fact that an overall goal  
12 for this workshop should be development of a  
13 strategic plan. One of the reasons for this, I  
14 think, is also, as part of our lessons learned and  
15 the process of some level of introspection is that  
16 most of you have followed ICH know that we  
17 developed a series of guidelines for the  
18 drug-review pharmaceutical-development phase.

19           Then, at the end, we kind of realized,  
20 well, gee, there is an opportunity for the CTD now  
21 because we have all these guidelines. This is a  
22 case where we are trying to do it the other way,  
23 something that ICH hasn't exactly done in the past,  
24 and really put together the strategic plan and what  
25 all the various pieces are. So we are starting

1 broadly and then we will, from that process, figure  
2 out which of those discrete topic areas we may want  
3 to take up, and kind of the rationale for why we  
4 take them up when we do.

5           Again, ICH has not done this kind of  
6 planning and so I think this will be a useful  
7 experiment to see how this shapes up at the  
8 Brussels meeting.

9           I just want to go back very briefly to  
10 give you some idea about the concept paper. I  
11 think all of this is in line with talk that  
12 Christelle previously gave on the procedures. One  
13 thing we just make sure we take note of is that the  
14 scope of the concept paper, which I do think is  
15 critical because we may be going forward to other  
16 venues for some of other aspects, we were very  
17 precise there and defined the scope, which was to  
18 assess the current state of and future directions  
19 for assuring drug-product quality.

20           This really had to do with things that  
21 could promote or encourage innovation as sort of  
22 our reason for being NICH.

23           Just a few words about the white paper.  
24 It was drafted by Brian Hasselbalch at FDA. We  
25 went through a very elaborate process of

1 organizational vetting to make sure that it really  
2 did represent the agency's best thinking. One of  
3 the things that you will also notice is that our  
4 goal here was to have all of the ICH partners come  
5 into the Brussels meeting with sort of the same  
6 amount of information so that that could be  
7 basically a level playing field.

8           If you attended the April workshop, you  
9 would have noticed that EFPIA did put forward their  
10 paper already. They presented that in April. In  
11 addition to that, we understand that we are going  
12 to be getting a paper, which is the European white  
13 paper, perhaps sometime this week or next, that  
14 they are about to finish theirs. I know the  
15 Japanese are working on something very similar as  
16 well.

17           So the goal would be to start the workshop  
18 with some fundamental background from all of the  
19 sponsors which would be shared and used as the  
20 basis for those discussions.

21           The time line, just to go over for you the  
22 time line for ICH, again, starting with that  
23 Brussels meeting, really, that will be a two-day  
24 discussion meeting talking about the current state  
25 of play and the identification of potential topics.

1 It is very unlikely that there could be a expert  
2 working meeting. Probably that will not happen  
3 until Spring of 2004. I think it is likelier that  
4 we will have some level of additional discussion at  
5 the meeting not in Tokyo but in Osaka in November  
6 just prior to ICH-6. I think probably that will be  
7 a concept-paper drafting session.

8           So when you look at the extended time  
9 line, you will notice that we are really not  
10 talking about having any sort of the Step-2  
11 document until, at the earliest, the Fall of 2004.  
12 It probably won't happen then. It probably will  
13 actually be maybe in the Spring of 2005 or sometime  
14 that year, depending on how many extra meetings  
15 they might want to have and how many would be  
16 agreeable to the steering committee to fund.

17           Back to the April GMP workshop summary and  
18 the international implications of that workshop,  
19 just to give you some idea of the kinds of things,  
20 again, that were mentioned that would have some  
21 sort of international component, I think. You see  
22 that we are sort of coalescing repeatedly along  
23 the same topic lines, but these would be things  
24 like how do you assess process capability, what are  
25 the general principles to assess new measuring

1 technologies, again general principles for  
2 different new manufacturing technologies, general  
3 principles about a quality-system approach.  
4 Always, we end up talking about risk assessment and  
5 risk management.

6           The other thing that repeatedly comes up  
7 internationally and also it is important here at  
8 FDA is how we link the review side with the  
9 inspection side. We are spending a great deal of  
10 time trying to work that out and what that means in  
11 terms of an overall quality-system approach.

12           The Brussels meeting, the snapshot; again,  
13 it is a two-day meeting. It will be co-chaired by  
14 the EU and by FDA. Those chairs are Gordon Monroe  
15 and Ajaz Hussain from FDA, Monroe for Europe.  
16 Again, what we are really trying to do is keep the  
17 discussion fairly broad, on the broad themes that  
18 are important for developing the strategic plan.

19           There will be a report to the steering  
20 committee that probably will come up on Friday  
21 morning. The meeting, itself, probably will start  
22 Wednesday afternoon and go all day Thursday. I  
23 think it is very likely, and this is just a  
24 forecast, but we are hoping that maybe two to three  
25 ICH topics could be selected. These would be the

1 things we would write the concept papers for in the  
2 fall.

3           Also, it is important to note that it is  
4 very likely at this meeting that pharmaceutical  
5 development will be agreed as an ICH topic. That  
6 is being folded under the GMP drug-product quality  
7 umbrella. It probably will also go down a very  
8 specific and discrete quality pathway within the  
9 ICH framework since there already was a lot of  
10 consensus about taking this up as a topic  
11 previously.

12           Again, just to reiterate, and I don't  
13 think there are any surprises here is you get used  
14 to seeing the same things crop up, the themes for  
15 discussion will be the team approach for assessment  
16 and inspection, knowledge sharing and transfer  
17 models as a basis for postapproval, variations,  
18 changes, management, mechanisms for collaborating  
19 or cooperating in other venues.

20           So, again, even though the meeting,  
21 itself, is being done as part of an ICH meeting, it  
22 is being done that way with the recognition that we  
23 are putting together a strategic plan. Some of the  
24 topics that get thrown out as important elements  
25 for that plan may not really be appropriate topics

1 for ICH.

2 One of the concerns that we also have is  
3 the ICH process really hasn't allowed for very much  
4 academic input so one of the things we will also be  
5 interested in is how do we get that kind of  
6 expertise into the program or what other venues are  
7 available where we might also benefit from that  
8 kind of expertise.

9 Then the other items that we will be  
10 talking about; again, quality by design, product  
11 process knowledge and risk-mitigation strategies,  
12 more on principles for how you introduce and how  
13 you regulate and assess new technologies and always  
14 we come back to risk-based concepts so system-based  
15 inspections.

16 So I think that really gives you a pretty  
17 good flavor or the kinds of topics--these are not  
18 new. They were pretty well discussed at the April  
19 workshop. I think the real challenge for us is  
20 going to be how do we put them together into a  
21 strategic plan and then prioritize them and figure  
22 out what makes sense to work on and when.

23 I want to turn now, for just a moment, to  
24 a part of this that really is not very well  
25 developed but is in the thinking stages. We have a

1 time line for regulatory cooperation in other  
2 venues beyond ICH. What we are proposing right now  
3 is in September to report to the GMP--and this is  
4 the GMP steering committee--a plan for inviting  
5 some regulatory speakers in so we can get  
6 information about their experiences. I have listed  
7 out who those might be.

8 In November of 2003, we would report again  
9 to the GMP steering committee on what the various  
10 activities that we would need to undertake as a  
11 long-range plan for how we would collaborate  
12 internationally on the regulatory aspects. I think  
13 what is important here is to keep in mind that the  
14 ICH part is really about science, innovation, new  
15 technology. But there is another piece of this  
16 that really is of great interest to the regulators.  
17 So we are going to be looking at those other venues  
18 in terms of how we can deal with that regulatory  
19 piece.

20 Again, it seems that PIC/s might be one of  
21 the organizations that would allow that to happen.  
22 However, we do have to note, right now FDA is not a  
23 member of PIC/s so one of the things that my  
24 committee is looking into is what are the  
25 implications of membership. Do we have the

1 resources to become a member? What would sort of  
2 the cost-benefit analysis of that be?

3 In the Fall and Spring of 2004, we would  
4 want to meet with stakeholders, get outside input  
5 and then we would probably need to meet with the  
6 FDA staff on the drug-product-quality systems, its  
7 experiences with PIC/s and possible ways for  
8 regulatory authorities to collaborate.

9 The overall plan is in May of 2004 to  
10 develop this long-term plan that gets presented.  
11 That wouldn't happen until June of 2004. That  
12 would be a concept paper to the GMP steering  
13 committee. This is the group that Janet Woodcock  
14 chairs. We would present our plan to that group  
15 and then I think it is quite likely that, from  
16 there, it would have to be vetted further within  
17 the agency, maybe at the executive council and so  
18 forth.

19 But our big deliverable is to have this  
20 detailed plan by June of 2004 so that some cuts can  
21 be made on how we are going to take the other piece  
22 of this--that is the regulatory cooperation  
23 piece--beyond what is happening in the ICH program.

24 I thank you. I will be happy to take  
25 questions if there are any. Yes.

1           AUDIENCE: Could you tell us what PIC/s  
2 stands for?

3           MS. SHOWALTER: It stands for the  
4 Pharmaceutical Inspection Convention/Scheme. The  
5 Scheme was added later. It originally was the  
6 Convention. But then there were some legal  
7 difficulties associated with whether the European  
8 countries could participate in a convention because  
9 specific regulatory authorities were members.

10           At that point, they changed it to the  
11 Scheme, and it is a much more voluntary organized  
12 group of people. Previously, it had been by  
13 treaty. So that is the difference. Also, it is  
14 regulatory authority with some observership status  
15 for industry and others. Currently, FDA is one of  
16 those observers. We are not a full member.

17           MR. JERUSSI: Robert Jerussi, Jerussi  
18 Consulting. The question I have, listening to your  
19 presentation today, Janet; it seems to me ICH has  
20 developed almost a life of its own. It is in an  
21 expanding mode. I recall when it was going to be  
22 over after the third or fourth ICH. I wonder if  
23 there is any end in sight.

24           I ask this question specifically because I  
25 believe, I firmly believe, ICH has escalated drug

1 requirements in the United States and it has slowed  
2 and raised the cost of drug introduction.

3 MS. SHOWALTER: So, as I understand your  
4 question, it is is there an end in sight. I  
5 suppose I am going to have to be a little flip here  
6 and I would have to say, based upon what I have  
7 seen, no. I think the short answer is no.

8 Any other questions?

9 MR. POSKA: Rich Poska from Abbott Labs.  
10 I was wondering if you can clarify; on one of your  
11 slides you mentioned transfer models as a basis for  
12 postapproval changes. What do you mean by transfer  
13 models?

14 MS. SHOWALTER: That is a good question.  
15 We spent a lot of time talking around that.  
16 Basically, what we are trying to identify, and,  
17 certainly, I am not the GMP expert so I am just  
18 going to give you my two-cents worth, but what we  
19 are really talking about how information that comes  
20 in in an application, really, what we should be  
21 talking about what we think is knowledge transfer,  
22 how you transfer, in a reasonable way, what you get  
23 to the other components, stakeholders, that have a  
24 part to play in that.

25 So I will tell you that one of the best

1 documents that I have seen on that, and I don't  
2 know if you have access to it or not, is the ISPE  
3 document that they put together fairly recently  
4 that sort of goes through the various models for  
5 the kind of tech transfer, knowledge transfer,  
6 information transfer, that we are talking about as  
7 part of a quality system.

8 That is one of the best explanations that  
9 I have seen. In fact, I think that it is possible  
10 that we may ask that group to make some sort of  
11 presentation about that at the upcoming meeting in  
12 Brussels.

13 AUDIENCE: Which group are you talking  
14 about?

15 MS. SHOWALTER: It is ISPE.

16 MR. POSKA: International Society of  
17 Pharmaceutical Engineers, ispe.org.

18 MS. SHOWALTER: I don't recall the date of  
19 the document but it is a fairly recent document.

20 POSKA: I was on the steering committee  
21 and we published it last year.

22 Any other questions? Thank you. This is  
23 going to conclude, then, the GMP section of this.  
24 I think, in summarizing, I would just like to say  
25 "Stay tuned." There is a lot still being talked

1 about and worked out.

2 Now we are going to go into the CTD-eCTD  
3 implementation status. We have a number of  
4 speakers for that. The first speaker is going to  
5 be Justina Molzon. She is going to give CDER's  
6 perspective. Following that, Bob Yetter will give  
7 CBER's perspective. Then Christelle Anquez will  
8 talk about what is happening the other regions  
9 followed by the eCTD discussion.

10 Justina?

11 **CTD/eCTD Implementation Status**

12 **CDER Perspective**

13 MS. MOLZON: Thanks, Janet. I am just  
14 going to be giving a quick update. I know some of  
15 you have heard this presentation at DIA last week,  
16 but we have actually had an additional submission  
17 for CTD so I have updated my statistics. I think  
18 my statistics on the applications into the Center  
19 for Drugs and how it is broken down by division is  
20 basically going to be the main thrust of this  
21 discussion.

22 Christelle has already given you  
23 background information on ICH. I will have a  
24 couple of comments focusing ICH initiatives on its  
25 CTD efforts. I will give you an update on what we

1 have been doing in CDER and then, as I have already  
2 mentioned, a discussion of some of the statistics  
3 related to CDER's CTD experience.

4 Christelle has already mentioned how ICH  
5 works. There is a series of expert working groups,  
6 safety, efficacy, quality and regulatory  
7 communications. Regulatory communications is a  
8 catch-all category and includes the CTD efforts.  
9 These working groups work on their various  
10 documents, present them to the steering committee  
11 and the steering committee then monitors and  
12 facilitates the work of the expert working group.

13 Christelle already showed you this slide.  
14 It basically covers the conferences that ICH has  
15 put on in an effort to be transparent. At the  
16 fifth conference, which was in San Diego in the  
17 Year 2000, the main focus of that conference was  
18 the Common Technical Document.

19 So what happened the few days before that  
20 major conference was that the expert working groups  
21 on the Common Technical Documents had to work in a  
22 frenzy to finalize those documents so they could be  
23 presented at the end of the week. So you literally  
24 had groups working around the clock. CDs were  
25 being burned the Wednesday night before the

1 Thursday meetings. There were disclaimers on these  
2 PDF documents that they still had to be edited for  
3 consistency.

4 After this frenzy was over, we realized  
5 that these three groups were actually working on  
6 isolation to finish these documents for  
7 distribution. Then, after ICH-5, these documents  
8 had to be edited for consistency, numbering system,  
9 style and format.

10 Janet has already mentioned how, in the  
11 GMP efforts, we are trying to have more of a  
12 strategic plan. I dare say that the CTD was  
13 created in this flurry of activity and, later on,  
14 we had to figure out how to provide consistency for  
15 the various documents that had been developed by  
16 the expert working groups.

17 So the reality of implementation is that,  
18 once the regulators start preparing these documents  
19 for publication, in our case, the Federal Register,  
20 or posting it on our web, we realized how  
21 complicated they were and we were faced with the  
22 enormous task of making them consistent.

23 This, along with the fact that regulators  
24 have different systems for implementations meant  
25 that, no matter how closely we worked together,

1 there were still going to be some minor  
2 inconsistencies. But these minor inconsistencies  
3 do not detract from the enormous work that has been  
4 done on the Common Technical Document, and the  
5 Common Technical Document should be as clear as  
6 possible.

7           So we have been devoting, along with  
8 Europe and Japan, much effort to do away with these  
9 ambiguities and inconsistencies at our ICH  
10 meetings. This is a continuous process and I  
11 believe that CTD has evolved and improved over  
12 time.

13           Many of you have seen this very simple  
14 diagram. This is how the CTD was initially  
15 presented. It has now evolved in a more  
16 complicated presentation based on discussions we  
17 have had at various meetings such as DIA raps or  
18 these open public hearings. We understood that  
19 people did not understand whether documents needed  
20 to be layered or stacked. So we added a numeric  
21 numbering system to indicate how we wanted these  
22 documents to be assembled. So outreach programs  
23 and discussions with our stakeholders have led us  
24 to clarify some of these issues.

25           The truth is we really need experience

1 with the documents and submissions will help  
2 industry and regulators to gain familiarity with  
3 the new CTD format. As I have already mentioned,  
4 meetings and discussions are helpful in improving  
5 these documents.

6 But because you needed experience with the  
7 documents to help implement them, the  
8 voluntary-submission phase was extended from July  
9 of 2002 to July 2003. So we added an extra year so  
10 there could be more experience on the regulator  
11 side and also on the industry side with these  
12 documents.

13 One thing that comes up at all of these  
14 public meetings is, someone asked, "Well, I thought  
15 the CTD was supposed to be same and now we have to  
16 do these differences." I need to point out that  
17 the Common Technical Document is not a global  
18 dossier, so a very common misunderstanding by those  
19 not involved in the ICH process.

20 The submissions contents is different for  
21 the U.S., EU and Japan. This is because there are  
22 still individual regulations in those countries  
23 that have never been discussed in ICH. They were  
24 either too contentious or industry, who generally  
25 proposes concept papers for topics, they just were

1 not proposed or they weren't taken up..

2           So the Common Technical Document is an  
3 agreed-upon format for the modular presentation of  
4 summaries, reports and data. It incorporates the  
5 relevant ICH guidelines as building blocks and puts  
6 them in the same order for submission to ICH  
7 regions. So we have had over fifty ICH guidelines.  
8 All the Common Technical Document does is stack  
9 them in the same order so they are in the same  
10 order for Europe, Japan and the U.S.

11           This question was also addressed in the  
12 Q&A process that has developed to help clarify some  
13 of the issues related to the Common Technical  
14 Document. So the very first question under the CTD  
15 general questions was, "Will a dossier using the  
16 CTD format, Modules 2 to 5, be identical for all  
17 regions?"

18           The answer was, "Not necessarily." The  
19 CTD provides a common format for the submission of  
20 information to the regulator authorities in the  
21 three ICH regions. However, the CTD does not  
22 address the content of submissions. This is in  
23 terms of regional requirements and sometimes  
24 applicants have different preferences for  
25 indications, dosage forms or whatever so there

1 could be a difference.

2 To help those submitting NDAs, BLAs,  
3 ANDAs, et cetera, to the FDA, we created a draft  
4 general considerations guidance called Submitting  
5 Marketing Applications According to the ICH CTD  
6 Format. This was posted in September of 2001.  
7 Originally, there was a comment period until  
8 November of 2001. Only twelve sets of comments  
9 were submitted. This was generally based on people  
10 just reading the documents after they were posted  
11 on our web.

12 I point out that comments are always  
13 welcome but to encourage comments from companies  
14 that have experience assembling these documents, I  
15 reopened the document until June 16 of 2003. That  
16 was just last week. So we are going to be  
17 collecting any additional comments. However, I  
18 just note that two weeks ago, I went to the docket  
19 and looked and there still were not any additional  
20 comments.

21 But we will incorporate comments from the  
22 steering committee, expert working groups and  
23 meetings such as this into our final draft of the  
24 general considerations document. So, please, send  
25 us your comments.

1           We also have established a web for  
2 electronic submissions called esub@cdcr.fda.gov and  
3 also cdt@cdcr.fda.gov. So you can send comments  
4 directly in to the FDA. We are trying to  
5 consolidate those comments. If you have very  
6 specific questions about your applications, they  
7 come in to either the esub or the CTD e-mail  
8 address. They are reviewed by basically the same  
9 person and then we come up with a consensus  
10 response.

11           Questions that would help the overall CTD  
12 process are taking to the ICH steering committee  
13 and expert working group meetings. So we have a  
14 few that we can take to Brussels in a couple of  
15 weeks.

16           What I really wanted to focus on during  
17 this presentation is exactly what is the experience  
18 that CDER has had with applications. So far, we  
19 have had twenty-five submissions. We received one  
20 when I was at DIA. I gave a presentation at DIA, a  
21 cohort of twenty-four. But now I can say  
22 twenty-five.

23           I have broken these submissions down by  
24 Office of Drug Evaluations I through V. So you can  
25 see that ODE I, Neuropharm, has had two. Oncology

1 has had three. The asterisks here indicate that  
2 there were three NME submissions to Oncology. Two  
3 to Cardiorenal. In ODE II, Metabolic and Endocrine  
4 had three. This is where there was a change.  
5 Originally, just last week, there were two. We  
6 just received one a couple of days ago.

7           So that provided for an additional NME so  
8 there are two NMEs. In Pulmonary, there are four.  
9 There are none in Anesthetic, Critical Care and  
10 Addiction Drug Products, none in Gastrointestinal  
11 and Coagulation Drug Products, three in Repro and  
12 Urological Drug Products, none in Medical Imaging,  
13 one in Antiinfective, two in Antiviral, two in  
14 Special Pathogens, and there are two NMEs in Ode V.  
15 There are three in Analgesic and Ophthalmic, none  
16 in Derm and Dental and none in OTC.

17           I just read those out for the transcript,  
18 so I'm sorry. I am sure you could have read all  
19 this yourself but I am trying to document the  
20 submissions.

21           If you look at distribution between the  
22 Offices of Drug Evaluation, it is really not that  
23 much different. There is just a scattering with  
24 ODE I and II having seven each.

25           If you look at the time frames,

1 considering that the CTD was accepted by regulators  
2 as of July 2001, I have broken these down into half  
3 years since then. So, from July to December of  
4 2001, there were five CTD submissions; January 2002  
5 to June 2002, three; July 2002 to December 2002,  
6 nine; and then January 2003 to June 2003, eight,  
7 with a total of twenty-five.

8 So, if you plot this out, you will see  
9 that the second half of the year 2001 to the second  
10 half of the year 2002, there has been an increase.  
11 The same from January to June of 2002 to January to  
12 June 2003. So there has been an increase. We then  
13 broke these out by months so you could get an idea  
14 of how these are submitted. We will get one. Then  
15 we won't get any. Then we will get one, skip a  
16 month. So it is just a scattering.

17 It was sort of predictable that, in  
18 December of 2002, we had more because people gear  
19 submissions toward the end of the year.

20 So, so far, there have been twenty-five  
21 submissions in CTD format submitted to ten  
22 different review divisions. All five offices, ODE  
23 I through V, have had experience and that  
24 experience is in terms of hybrids which is either  
25 just the safety module submitted in CTD

1 format--that is the pharm-tox information--or the  
2 quality modules just submitted in the CTD format.  
3 Then the rest of the application would be an NDA or  
4 a BLA in Bob's case.

5 New dosage forms was another CTD type of  
6 submission, new indications. and then NMEs or  
7 complete CTDs. So what I did to further delineate  
8 on experience, I looked at a typical NDA review  
9 team which is project manager, the medical officer,  
10 chemist, statistician, pharmacologist,  
11 pharmacokineticist, clinical microbiologist and a  
12 microbiologist.

13 I just tried to plot the exposure for each  
14 of these types of submissions. So, for a pharm-tox  
15 hybrid, the project manager and the pharmacologist  
16 would have experience. For a quality hybrid--that  
17 is just the CMC section in CTD format, project  
18 manager, chemist and a microbiologist, perhaps.  
19 For a new dosage form, once again, project manager,  
20 chemist, but a pharmacokineticist might be involved  
21 if it from a tablet to a capsule or vice versa and  
22 then a microbiologist for sterility issues.

23 For a new indication, project manager.  
24 You would be involving the medical officer and,  
25 perhaps, a statistician, the pharmacokineticist and

1 possibly the clinical microbiologist if it had to  
2 do with an antiinfective or antibacterial product.

3 Then, for a new combination, you have  
4 included more and then, finally, for an NME, the  
5 entire review team would be exposed to the common  
6 technical document.

7 So the good news about these submissions  
8 are that there were no "refuse-to-file's". These  
9 were not perfect submissions but they could be  
10 reviewed. I should note that CDER has been  
11 flexible during this voluntary submission phase  
12 because we wanted to encourage submission of these  
13 documents so we could gain experience.

14 In terms of the number of companies  
15 submitting these documents, there have been  
16 nineteen different companies. Several of them have  
17 submitted two or three submission in CTD format.  
18 Breaking the companies down, there were nine large  
19 PhRMA companies, six mid-size companies, four small  
20 companies that had just one or two application  
21 overall and then the World Health Organization also  
22 submitted an application.

23 On July 1 of 2003, the Common Technical  
24 Document will become mandatory in the European  
25 Union and Japan. It will be highly recommended by

1 the FDA. The reason it is highly recommended  
2 instead of mandatory is that ICH documents have  
3 always been considered guidance by the FDA. Good  
4 guidance practices, or GGPs, require that the CTD  
5 not be mandatory.

6 So this is not an indication of lack of  
7 commitment. It is just that our good guidance  
8 practices indication that these documents have to  
9 be guidance and not mandatory. So, presubmission  
10 meetings indicate that many companies are following  
11 this recommendation.

12 In terms of presubmission meetings, this  
13 is an indication of the next wave of CTDs that will  
14 be submitted. I have been invited to twenty-one  
15 presubmission meetings for CTD-formatted NDAs. I  
16 generally go to a presubmission meeting with staff  
17 from Dr. Randy Levin's group, the Office of  
18 Information Management, so that we are available to  
19 the Review Division just to answer questions on the  
20 Common Technical Document because, if the reviewers  
21 have not received one to that date, we have a basis  
22 of experience that can help them.

23 We are also available to help sponsors  
24 with questions on how the documents should be  
25 formatted. As I have already mentioned, with the

1 esub and ctd e-mail addresses, we are trying to  
2 collect areas of concern and issues that require  
3 clarification.

4           At the presubmission meetings, the  
5 sponsors were advised to follow the updated  
6 information on the ICH web which is [www.ich.org](http://www.ich.org).  
7 Because of our good guidance practices, it takes a  
8 while for our editors to convert the ICH-harmonized  
9 documents into the GGP-prescribed format. I also  
10 tell the sponsors that they should look at the ICH  
11 website just to check up on the Q&As that have been  
12 updated after each of the ICH meetings because  
13 these are helpful in assembling the CTD-formatted  
14 submissions because, often, another company has had  
15 the same issue that you are concerned about and  
16 there has been a coordinated consensus response in  
17 terms of the CTD disciplines. The Q&As are set out  
18 in terms of safety questions, efficacy questions,  
19 quality questions and then just general questions.

20           Basically, the specific information that  
21 is relayed at these presubmission meetings are; do  
22 not modify the CTD table of contents, submissions  
23 should exactly match the CTD, provide all  
24 information under CTD-ICH-negotiated headings and  
25 numbers, do not create new headings or numbers.

1 I have basically tried to say the same  
2 thing four different ways so people realize that  
3 you really should not modify the headers and  
4 numbers in the CTD format because that is what it  
5 is. You can't change or modify the numbers or  
6 headers in any way.

7 Additionally, if a company does not have  
8 information for the section, provide the ICH CTD  
9 number and header and then put "non applicable," or  
10 some other language. Don't skip or delete sections  
11 and never renumber sections. I have actually seen  
12 applications where someone just left something out  
13 and then went on with different numbers. So they  
14 had to redo their numbering system because that  
15 just wouldn't help them in the process because the  
16 numbers have to be the same and the headers have to  
17 be the same as the ICH CTD documents.

18 At the ICH meetings last February in  
19 Chiba, Japan, additional sets of Q&As were endorsed  
20 by the steering committee and were posted on the  
21 ICH website. Some of these were related to general  
22 matters but some were also very specific. There  
23 was a very lengthy discussion of the ISS and the  
24 ISE and the need to include it in the CTD in some  
25 manner.

1 But the meetings also focused on the eCTD  
2 which you are going to hearing about later from Tim  
3 or Randy. I always recommend that companies check  
4 the ich.org website after ICH meetings for the most  
5 recent information. So we are going to be going  
6 through the same process in Brussels. We will go  
7 over Q&As that have been proposed. We will try and  
8 finish up any problems that are still remaining in  
9 terms of confusion or clarification with the CTD.

10 So the next steps for CDER are we are  
11 going to continue to meet with project managers for  
12 feedback on CTD submissions. Increased submissions  
13 will help determine the effects on the review  
14 process, if any. This may help organizes reviews  
15 and reviewers a little bit more.

16 Presubmission meetings indicate more CTDs  
17 are on the way. CDER is looking forward to  
18 receiving submissions so that both industry and  
19 regulators can experience the CTD format. So we  
20 have a nice cumulative curve developed and I would  
21 just like to see many more submissions.

22 Thank you very much for your attention.

23 Are there any questions?

24 MR. MILLER: Loren Miller, PPD. The  
25 question I had as, of the submissions you have had,

1 how many were electronic and, secondly, of the full  
2 submissions, how many required a separate ISS or  
3 ISE that was taken out of the context of the--

4 MS. MOLZON: In terms of electronic, there  
5 has been a mixture. Some of the applications would  
6 come in according to the eNDA procedure but then  
7 the CTD portion would be in paper. So, depending  
8 on the company and the approach, there was a nice  
9 mixture. So we are going to be looking into those  
10 statistics. I haven't broken things down to that  
11 extent.

12 In terms of the ISS-ISE, there has been a  
13 variety of approaches. Dr. Temple did a very nice  
14 presentation at DIA which will be posted. All of  
15 the DIA presentations from CDER will be posted on  
16 the website. It is just depending on the type of  
17 application you have and it is basically if the  
18 documents you have put together for ISS-ISE  
19 requirement can fit into the overview and the  
20 summary, then you do that. If not, you are going  
21 to have to put some of the narrative in those  
22 sections and then the data in Module 5.

23 So it is really a case-by-case situation  
24 based on the size of the submission and the type of  
25 documentation you are providing.

1 MR. POSKA: Rich Poska, again, from  
2 Abbott. You mentioned that, and I recognize that  
3 the CTD is only intended to provide a common  
4 format, but in your presentation you mention that  
5 it does not address the content of the submission  
6 because of regional requirements and regulations.

7 However, the previous presentation that we  
8 had did talk about some initiatives that the FDA is  
9 working on towards trying to harmonize certain  
10 things. You talked about the concept paper on  
11 specifications. I think one of the largest  
12 benefits we can get out of CTD is, at least from an  
13 industry standpoint, to try to get harmonized  
14 requirements and specifications.

15 So my question is, should we expect to see  
16 the long-awaited stability guidance from the FDA to  
17 be incorporating more ICH and less regional type  
18 requirements that will be more or less transparent  
19 or will it still contain inconsistencies with the  
20 ICH and require us to have separate sections for  
21 global applications.

22 MS. MOLZON: I have a major disclaimer. I  
23 am not in the Office of New Drugs and I haven't  
24 seen the stability guidance. As I said, this is  
25 the beginning and things are evolving. It is hard

1 to imagine exactly what is going to go on in GMPs.  
2 All these things are up for discussion. So you  
3 have started the framework. So now you have some  
4 additional topics to talk about.

5 This is where we are right now. It would  
6 be nice to move towards more harmonized, but I  
7 can't predict that.

8 MS. SHOWALTER: One comment about that is  
9 that, at every ICH meeting, there is now a section  
10 where we talk about implementation issues. For  
11 things like stability, and there is actually a  
12 mechanism for getting this aired  
13 internationally--and I think it is an important  
14 component of the program, as we move more into an  
15 implementation phase.

16 So what I would do--and the vehicle for  
17 making all of that happen is really through PhRMA.  
18 So I would encourage, for those kinds of issues to  
19 be taken up within PhRMA and then they should be  
20 put on the table.

21 There is a time line involved in this. It  
22 is too late for the Brussels meeting. Basically,  
23 the way you want it come up is you want it to be  
24 very well defined and described in a paper that  
25 PhRMA, then, could float hopefully, if it is with

1 FDA, to FDA first or if it is with Europe, to  
2 Europe first.

3 But then, if the issue can't be resolved  
4 or is not resolvable, then it really should be  
5 taken up as an ICH implementation issue. We  
6 actually encourage that. So there is a procedure  
7 put in place pretty much heretofore that has been  
8 empty. That section hasn't been discussed because  
9 nobody floats anything.

10 It is sort of interesting to me. Prior to  
11 us taking that one, there seem to be all kinds of  
12 implementation issues. But, once we put it on the  
13 program as a specific agenda item, they just went  
14 away. But I would encourage steps to be taken to  
15 make that happen because we really should be taking  
16 about implementation issues.

17 If we want to preserve what we have  
18 already achieved, we have to do that as well. And  
19 we understand that. So we would encourage that.

20 I just have a quick question. Is the  
21 flexibility going to remain the same or will it  
22 change as of the first of July?

23 MS. MOLZON: No; we are always flexible,  
24 in my opinion. You are submitting these documents  
25 and good guidance practices are very helpful in

1 this situation. Because these documents are not  
2 mandatory, we allow leeway for discussion between  
3 the sponsor and the Review Division as to how they  
4 want things put together.

5 But the headers and the numbering systems,  
6 there is no negotiating on that. That is not  
7 flexible. We were flexible in just discussing with  
8 the sponsors on how the documents were put together  
9 and we are going to be less flexible in terms of  
10 numbers and headers.

11 We were just trying to get the sponsors  
12 used to these formats. But now they have to adhere  
13 to the numbers and the headers.

14 MS. SHOWALTER: Thank you.

15 The next speaker will Bob Yetter and he  
16 will provide CBER's perspective on the Common  
17 Technical Document.

18 **CBER Perspective**

19 MR. YETTER: Good morning. It is a  
20 pleasure to be here. I hope you will bear with me  
21 a little bit. I am not quite as recovered from a  
22 sinus infection as I had hoped I would be by now.

23 Justina told you about CDER's CTD  
24 implementation plan and, to a great extent, it  
25 reflects the FDA's implementation plan. You have

1 seen this consensus diagram of what the CTD is all  
2 about. The process that we have undergone in CBER  
3 looks very much like CDER's. It involves  
4 publishing and revising guidances as needed,  
5 addressing certain administrative issues, training  
6 staff and outreach to the industry.

7 The primary guidance involved is the one  
8 that Justina mentioned earlier, the general  
9 guidance on submitting marketing application in ICH  
10 CTD format. That one has an introduction and  
11 background, talks about the CTD format, itself,  
12 provides considerable information on Module 1 and  
13 general issues for submissions. All of that is  
14 very important for people being able to use that.

15 We have extended the comment period. It  
16 has again closed but we extended the comment period  
17 until June 16 to get further comment once people  
18 got some experience with working with the CTD so  
19 that we could find out where the problems were,  
20 where the issues were.

21 We will use those comments that we got in  
22 and revise the guidance and get out a final  
23 guidance. In CBER, we instituted what would be  
24 called an administrative issues subgroup to address  
25 certain problems or to make sure that there were

1 not certain problems. What it was intended to  
2 address was concerns surrounding receiving,  
3 reviewing, processing and archiving applications in  
4 the CTD format.

5 They were supposed to look at needs for a  
6 smooth transition and predict potential  
7 difficulties and identify any remedies for the  
8 difficulties and identify training needs.

9 Applicability and scope; I am going to  
10 mention this because recently, with other  
11 initiatives, these questions have come up. ICH was  
12 originally intended to address pharmaceutical  
13 products and specified biotechnology products.  
14 CBER has a variety of products including specified  
15 biotechnology products that fit within the ICH  
16 definition. But, as of the end of this week, the  
17 majority of those specified biotech products will  
18 be transferred to the Center for Drugs.

19 That has raised the question of where is  
20 the Center for Biologics in terms of  
21 implementation? What is going to happen with the  
22 CTD for CBER if most of the products that this was  
23 intended, originally intended, to be applied to,  
24 will transfer?

25 I am going to go back to what that

1 administrative issues subgroup found out. They  
2 went off to work with their respective offices and  
3 really identified no major issues for the  
4 implementation of the common technical document.  
5 There were no serious concerns about receiving  
6 them. There were no serious concerns about  
7 reviewing them and certainly no concerns about  
8 archiving them.

9           They looked at the potential benefits of  
10 the CTD for CBER. Increased harmonization between  
11 the NDA and BLA; now, that is something we have  
12 been directed to do since FDAMA in 1997. Increased  
13 consistency between applications; one of the  
14 biggest problems that we have is that every BLA  
15 that comes in, because there is no real prescribed  
16 format in regulation for a BLA, every BLA that  
17 comes in is unique.

18           This provides us more consistency in what  
19 will be coming in. It will facilitate  
20 communication within the FDA and between CBER and  
21 the sponsors, we believe. So it is a more  
22 predictable format which would allow for more  
23 consistent reviews and easier analysis across  
24 applications, something that we frequently do to  
25 try and predict trends and develop guidance

1 documents to provide industry more information on  
2 what we expect. In other words, we go back and  
3 look across applications to see where things are  
4 not clear to industry. This is going to make that  
5 effort easier.

6 So where does that leave CBER with respect  
7 to the CTD? We intend to continue to implement the  
8 CTD for our products, all of our products that are  
9 licensed. We will apply it to vaccines. We will  
10 apply it to the biotech products that are not  
11 transferring and we will apply it to the licensed  
12 products that remain in CBER, the traditional  
13 biologics.

14 We have to date, and I haven't got all of  
15 the wonderful statistics that Justina had on what  
16 we have received, but we have received, in complete  
17 CTD format, fewer than ten new applications or  
18 supplements. I don't have any numbers on how many  
19 partial CTD submissions we have gotten.

20 One of the difficulties in assessing this  
21 is that we have not actually gotten a CTD in paper.  
22 All of these have been fitted into our current  
23 electronic BLA submission paradigm. They have all  
24 come in electronically. Had they been printed out,  
25 they would have been nice paper CTDs. But they

1 don't actually take a true CTD format because they  
2 are fit into the current eBLA submission approach.

3 Now, as the eCTD becomes available, we  
4 expect that those will be submitted in the proper  
5 eCTD format and we will begin to gain experience  
6 with that.

7 So that is where we are with  
8 implementation of the CTD in the Center for  
9 Biologics. I would happy to entertain any  
10 questions.

11 MS. GAWRYLEWSKI: Helle Gawrylewski,  
12 J&JPRD. You both mentioned that the comment period  
13 for the general considerations document was closed  
14 but Justina intimated that comments would still be  
15 accepted. Is that true both for CBER and CDER?  
16 What would be the window of opportunity to submit  
17 additional comments?

18 YETTER: As a fact of the good guidance  
19 practices, you may comment on any guidance document  
20 at any time.

21 MS. SHOWALTER: Thank you, Bob. Next on  
22 the agenda, Christelle is going to give you just a  
23 few brief comments about what we have learned that  
24 is happening in the other regions with respect to  
25 the Common Technical Document.

1                   **Other Regional Perspectives**

2                   MS. ANQUEZ: I will give you a brief  
3 update on the CTD implementation that we authorize  
4 in the three regions, Europe, Japan and Canada. I  
5 don't have slides for this. I'm sorry.

6                   As you know, the three regions are getting  
7 ready for the July deadline which is the time when  
8 the CTD will be mandatory in Europe and Japan and  
9 strongly recommended in Canada.

10                  In Europe, they received twenty-six  
11 submissions using the CTD format of which sixteen  
12 are in full CTD format and six are in mixed CTD and  
13 old Europe dossier format.

14                  Among these twenty-six applications, there are six  
15 on biotech products and twenty-one on new chemical  
16 entities.

                                Japan received sixteen  
17 submissions in CTD format, five for biologics and  
18 biotech products and eleven for chemical drugs.

19                  Among the submissions for chemical drugs, five were  
20 for already approved drugs, one for a combination  
21 process and five for new chemical entities, new  
22 drug applications.

23                  The Japanese have already had three  
24 meetings with JPMA, their pharmaceutical industry  
25 association, to explain how to compile CTD

1 documents in April, 2003. Following this meeting,  
2 Matilda Bilieu is planning to publish within the  
3 next month a notification about the revised CTD  
4 guideline document as well as a Q&A document which  
5 contains Q&A agreed on in the ICH meeting in Tokyo  
6 in February.

7 In Canada, they have been very actively  
8 preparing for the July 1 deadline, as you will see.  
9 They received sixty submissions in CTD format,  
10 fifty for chemical entities of which thirteen were  
11 for new drug submissions, twelve for supplemental  
12 new drug submissions and twenty-three for  
13 abbreviated submissions.

14 The ten remaining concerned biologics and  
15 radiopharmaceuticals. Health Canada had two  
16 sessions with industry in late April and, following  
17 these, they revised a number of guidances. They  
18 revised the general filing guidance to take into  
19 account the most recent ICH decisions and guidance.  
20 They also prepared a revised guidance on the filing  
21 of bioequivalence studies in the CTD format that  
22 includes a description of how such information  
23 should be filed within the E3 framework. They  
24 should permit the use of the clinical-study report  
25 for general application.

1 Health Canada also prepares quality  
2 guidances to assist sponsors in the filing of  
3 applications for vaccines, conventional biologics  
4 and blood products. A similar guidance is also  
5 near completion for radiopharmaceuticals. They  
6 also revised the drug guidance on biotech products.

7 All these guidances will remain as drafts  
8 until the fall. This will allow them to  
9 incorporate other amendments following up the  
10 discussions which will occur in Brussels.

11 The notice and all these accompanying  
12 document guidances will be posted by next Friday on  
13 the Health Canada website. Lastly, the original  
14 Q&A will be published in conjunction with the ICH  
15 CTD Q&A after the Brussels meeting.

16 Thank you.

17 MS. SHOWALTER: Thank you, Christelle.

18 The next presentation will be on the eCTD  
19 and Tim Mahoney is going to provide that.

20 **eCTD**

21 MR. MAHONEY: Good morning. Thank you for  
22 coming to sunny Washington, D.C. Every day is  
23 sunny here--at least today is, anyway. I am here  
24 to talk about the eCTD. We have been pretty busy  
25 in the FDA and in the eCTD Implementation Working

1 Group because we are now an implementation working  
2 group. We are not just an expert working group.  
3 So we are working on implementing the eCTD in the  
4 three regions.

5 I am going to focus primarily on what we  
6 are doing in the FDA in the U.S. but let you know  
7 what we are going to talk about in a few weeks in  
8 Brussels.

9 I am not sure of your background, what you  
10 know about the eCTD. Are you familiar with it? I  
11 started to become familiar with it in August and  
12 there are a lot of acronyms; eCTD, CTD, ICH, ETB,  
13 all those different things. I don't know what your  
14 background is. So I will explain the eCTD a little  
15 bit.

16 There has been some mention of, and  
17 Justina mentioned, CTDs coming in with some  
18 electronic components. There is a very clear  
19 distinction between the ICH eCTD and an electronic  
20 eCTD. They are not the same. They are very, very  
21 different so we need a way to view eCTDs. I am  
22 going to tell you how we will do that and when as  
23 well as the next steps for both the FDA and ICH  
24 eCTD IWG and where you can get more information.

25 The eCTD is an ICH specification,

1 obviously. This is an ICH public meeting. To be  
2 implemented in the U.S., EU, Japan as well as  
3 Health Canada has a very strong interest in  
4 implementing the eCTD and harmonizing with the FDA.  
5 It is not a content function. The eCTD IWG doesn't  
6 address content. We take the CTD and transfer it  
7 electronically from applicant to regulator so we  
8 are not a content group.

9 But what it does for the FDA and for the  
10 other regions is it provides first and foremost a  
11 cumulative view, a table-of-contents view, rather  
12 than the folder-file structure that you may be  
13 familiar submitting in the U.S. This will be a  
14 cumulative view so, as your submissions come in for  
15 an overall market application, a cumulative view  
16 will be built. And it is consistent.

17 That was addressed a little bit earlier,  
18 but it is the same table of contents and the eCTD  
19 is not flexible at all. There are rules to  
20 submitting an eCTD, not FDA rules but technology  
21 rules. So you have to follow what is called the  
22 document-type definition in order for this to work.  
23 But what it will also provide is a consistent table  
24 of contents for both you building it and our  
25 reviewers reviewing it for INDs, NDAs, BLAs, ANDAs,

1 DDMAC promotional material and everything, if you  
2 have read the draft U.S. Module 1, all the  
3 different components in there.

4           So you will be doing the same thing. Our  
5 reviewer will be looking for the same information  
6 across all these different types of marketing  
7 applications. Its components mirror the CTD. It  
8 is actually taken directly from it. Module 1 is  
9 defined in each region. The U.S. has a draft  
10 Module 1 ready to go. Modules 2 through 5, their  
11 content is defined in ICH. So, for those of you  
12 were not quite familiar with the eCTD, hopefully  
13 that helps a little bit. How is the FDA going to  
14 let you know what we are doing here? A lot of the  
15 eCTD specification leaves things open to regional  
16 guidance. It really wasn't that we were running  
17 out of time in the working group and said, "We will  
18 just regional guidance." It was really that there  
19 are distinctions. Justina made a really good  
20 point. This is not a global submission but it is a  
21 common format for submitting in the three regions.  
22           Some of those things, especially when you  
23 take PDF files and use them in Japan, there are  
24 distinct differences. So there are going to be  
25 some differences across the regions but the

1 technology is the same.

2           The FDA has released eCTD specifications.  
3 They support a soon-to-be-published eCTD guidance.  
4 You may have recently seen an eCTD guidance and  
5 that was really just the local publication of the  
6 Step 4 eCTD specification. But this week, as a  
7 matter of fact yesterday, on the website you see up  
8 there, [www.fda.gov/cder/regulatory/ersr](http://www.fda.gov/cder/regulatory/ersr), we  
9 published a series of specifications that fill in  
10 the technical blanks for eCTD implementation in the  
11 U.S., particularly Module 1. It is not just a  
12 document-type definition file. It is a narrative.

13           Modules 2 through 5, study reports, which  
14 is an interesting topic, one that we have sort of  
15 bounced around in ICH. The Step-4 eCTD  
16 specification was signed and then we received  
17 comments that it really doesn't provide the  
18 structure for study reports that the CTD  
19 references. So we have had some debates and some  
20 good conversations and some harmonization in the  
21 eCTD IWG.

22           That has resulted so far in what is called  
23 the study tag-in file which is a way for you to  
24 follow the eCTD Step-4 specification as well as  
25 provide the granularity in the structure that we

1 need for those study reports.

2 XML is the technology you use to create  
3 and eCTD. If any of you here are not coders or  
4 developers, then you have absolutely no need to  
5 understand XML. You are not going to have to. But  
6 what they call it is human-readable XML. I don't  
7 know if that is really the case. If you have ever  
8 tried to read XML, you are still human but it is  
9 not as readable.

10 So we have a real human readable overall  
11 FDA eCTD table of contents published on there as  
12 well. And we welcome comments. Now, the draft  
13 guidance is making its way, per our good guidance  
14 practices, through the different centers affected.  
15 This is a combined CBER-CDER project, as Dr. Yetter  
16 mentioned. But these specifications can help  
17 particularly the technical folks that are going to  
18 help you prepare an eCTD.

19 These are all posed on a website that  
20 gives suggestions for the steps to submit in an  
21 eCTD. Step 1 is to read all of that. Then, when  
22 you are done in October reading all that, get back  
23 to us and let us know when you are planning an  
24 eCTD. The technology is new. It is new for you.  
25 It is new for the FDA so we want to make sure that

1 there is a good dialogue going.

2           The esub e-mail that Justina mentioned is  
3 the place to go. Let them know exactly when so we  
4 can prepare on our end getting the training in  
5 place for reviewers and also getting ready to test  
6 your sample and make sure that it will display the  
7 way you want for the reviewers.

8           It won't be a real labor-intensive  
9 process. It will be just exchanging small files  
10 for any of the quick tests and getting back to you  
11 saying, "Hey; everything looks okay," when we are  
12 finally done. Then you will be ready to submit.

13           I will leave this up for a moment so you  
14 can write that down. This is part of the U.S.  
15 Module 1 DTD, document type definition. It is  
16 pretty clear with the leaf content in there. Up to  
17 this point, a lot of concentration has been on the  
18 XML. That really shouldn't be the case. That  
19 should be left to the technical folks. It is, what  
20 does the XML do. Here is more of that U.S. Module  
21 1.

22           Building that cumulative table-of-contents  
23 view, giving us the ability for life-cycle  
24 management to reference across different  
25 submissions. That is what you need to know about

1 the XML. You don't need to know what an href or  
2 what a leaf--well, a leaf, you may. But you don't  
3 have to know XML, just the ability it gives both  
4 you and us. That is why this is important to you.

5 This isn't just going to help our  
6 reviewers, but if you can archive and store and  
7 generate your information standard across many  
8 different application types and then across many  
9 different regions, that initial up-front investment  
10 will return pretty quickly to you.

11 A little bit better, a little more human  
12 readable description of the U.S. Module 1 for the  
13 eCTD contains this information. I won't run  
14 through the entire list because the information is  
15 up on the web and you can take your time and  
16 disseminate it.

17 But there is a good bit of information.  
18 And it does allow for submitting electronic INDs.  
19 Particularly CBER has had an electronic IND  
20 guidance out there but CDER has been waiting for  
21 the eCTD. And it is finally here.

22 So how are we going to view these, all  
23 that gobbledegook you saw on the U.S. Module 1  
24 there? What we are using to start off with is an  
25 internally developed system called the eCTD Viewer

1 System. It is a combined CDER-CBER project. If  
2 you remember Dr. Levin, particularly John Clark,  
3 Nike Ya, several years ago presented the Cumulative  
4 Table of Contents Viewer. It was really a few  
5 chemists were trying to solve a need, that  
6 cumulative view need.

7 That is the prototype that we built the  
8 system on so it looks a lot like it but it is meant  
9 for production across the two centers. It is built  
10 by reviewers. I work in an IT shop and content is  
11 something I don't know much about when it comes to  
12 the science of what we do at the FDA. How they  
13 want to view it, also, I wouldn't know much about.  
14 So reviewers build the system. They define the  
15 prototype and the production system. We just take  
16 care of the technical end.

17 They approve all change requests or a  
18 configuration-control board. So they are actively  
19 involved. They are also part of our outreach plan,  
20 so we are going around to the particular divisions  
21 right now from those CCB members presenting the  
22 viewer.

23 The initial functions we are going to have  
24 in the FDA, all of the things I mentioned about the  
25 eCTD that it will let us do, we would develop over

1 time. Some of them we need to gain more experience  
2 on, but view, navigate and download. The system is  
3 in production. It works. It is in both CDER and  
4 CBER. If an eCTD were to be submitted today, and  
5 it was created correctly, we could process it and  
6 view it in each center. Technically, we are ready.

7 We spend a lot of time going through  
8 requirements gathering, doing use cases and all  
9 these other different methodologies you may not be  
10 familiar with. We also identified additional  
11 requirements that really we need a little more time  
12 with the eCTD to develop, particularly,  
13 preferences, quick access to an area of an eCTD,  
14 searching and book marking.

15 A lot of that is going to be CTD as well  
16 as eCTD education, so as we get experience with  
17 them, we will add that functionality. So what do  
18 we need? We need guidance and we need  
19 specifications. The draft guidance is ready for  
20 internal sign-off and the specifications are  
21 posted. So we can almost check that one off.

22 We need a system. That one is installed  
23 and being configured. We can check that off. And  
24 we need outreach. We need to let everyone know how  
25 to do this. We are in the middle of that. We are

1 supporting internally our reviewers, those that  
2 support the reviewers and the technical staff. We  
3 are working with Dr. Levin's Office of Information  
4 Management to provide just-in-time training.

5           So, when you let us know you are  
6 submitting an eCTD, we will guarantee that the  
7 reviewers are trained. If you don't let us know,  
8 we can't guarantee that. So training is a big part  
9 of the internal and external as well. And then  
10 maintaining the system.

11           So what we are doing now; we have a couple  
12 of small change requests on the system but we are  
13 doing a lot of outreach. Presentations to  
14 divisions--and they have been very positive. Even  
15 those reviewers that really hold on to paper and  
16 don't want to let it go see the power that the eCTD  
17 provides them with that first cumulative  
18 table-of-contents view. It is really a tradeoff,  
19 and it is a good tradeoff to the eCTD.

20           We are preparing for eCTD. I already went  
21 over these steps. We are going to watch this. We  
22 are going to maintain both the eCTD specification  
23 in ICH and our system internally at the FDA. Part  
24 of that is the next meeting in a few weeks. The  
25 agenda in change control. Technology cannot remain

1 static.

2           You may be familiar with a word called  
3 "shelfware." So you spend a lot of time and they  
4 spent years developing the ICH. If there is no  
5 process in place to control change, it become  
6 obsolete. Really, none of that existed in ICH.  
7 So, after Step 4, the first thing we did was  
8 develop a change-control process.

9           A lot of technology is guessing until you  
10 start implementing. Then it is going to change.  
11 So we need a way to prioritize, first accept, then  
12 prioritize and address change requests. One of the  
13 first one is that study report. That will be one  
14 of the first things we talk about, showing our  
15 examples in the U.S. with the study tag-in file.

16           There may be a different future down the  
17 line for study reports in the eCTD but, for now,  
18 the study tag-in file is the way the FDA is going.  
19 We are releasing a comment style sheet for those  
20 that don't have eCTD-viewing software. It is very  
21 similar to a web browser. It provides the content  
22 and will give you a common view between the  
23 regulator and applicant.

24           So the FDA has created it. We took the  
25 burden on ourselves to create it and will present

1 it with our partners' approval to the steering  
2 committee next month.

3 Another thing we need to think about are  
4 DTT releases. Those of you here from software  
5 developers, this is of particular importance to  
6 you. One thing that our PhRMA partners that we  
7 work on, they get nervous with every meeting  
8 because they don't quite know what is going to  
9 happen. If there is an industry out there building  
10 eCTD software, we can't do that, too. So we are  
11 going to talk about scheduled releases of DTT  
12 changes as they reflect changes in content to the  
13 CTD or changes in technology.

14 We are also the M2 expert working group.  
15 As that, we have been tasked to look at technology.  
16 Recommendations we have made in the past, which are  
17 outdated, include media types. Then we need to  
18 confirm our ICH-6 topics and speakers.

19 So what we are going to do at the FDA, we  
20 are going to be future versions of the eCTD viewer.  
21 We are not a software development company in the  
22 FDA. So, if someone else is out there doing it  
23 better, cheaper, faster, we will take a look at it.  
24 So part of that is doing alternatives analysis on  
25 those commercial products that can be used to meet

1 our needs for viewing and processing eCTDs.

2 For those of you who would like to see  
3 what we are doing, we are going to put it out there  
4 this summer. We will post our eCTD viewer and  
5 related documentation and you can do whatever you  
6 want with it, except complain about the way it was  
7 developed over and over again. So, we won't be  
8 able to trouble shoot if you want to install it in  
9 your own environment, but we have pretty good  
10 documentation. It is all CMM Level-3  
11 documentation. So you should be able to do it.

12 More information; esub@cder.fda.gov. That  
13 is a great place to go. Really, if you send me an  
14 e-mail, I am about 348 behind so get in line. But  
15 esub always responds. Part of our change-control  
16 process in ICH is filling out change-request forms.  
17 If you notice something wrong with the eCTD  
18 specification, something is missing or even if you  
19 have a general question, in the CTD page, along  
20 with the eCTD specification, is a change-request  
21 form as well as those change requests that we have  
22 already identified.

23 So, if you see something up there already,  
24 we are working on it and we will get to it as soon  
25 as we can. If you have any from the U.S. that you

1 want to send, you can send them directly to me at  
2 that e-mail. I will do them quickly if you are  
3 trying to make the July meeting, as within the next  
4 hour.

5 So thank you for your time. Can I ask are  
6 there questions? What are your questions before I  
7 step down?

8 MS. GAWRYLEWSKI: Helle Gawrylewski,  
9 J&JPRD. I have a question about the study-tagging  
10 files. So FDA has a proposal and you are taking it  
11 to the M2 expert working group. I understand there  
12 will be some discussing and arguing about that  
13 specific element of the eCTD proposal. What is the  
14 mechanism to propose alternative ways of doing this  
15 study-tagging at this point, realistic mechanisms?

16 My second question is when did you post  
17 all of this at the website because I looked  
18 yesterday and I didn't see anything new. Was it  
19 late?

20 MR. MAHONEY: It was late.

21 MS. GAWRYLEWSKI: It was late?

22 MR. MAHONEY: Late for us in the  
23 government. It was about 3:30. That is a good  
24 question. The study-tagging file, the good thing  
25 about our change-control process that I mentioned

1 is we don't argue. We do discuss, though.  
2 Arguments really go nowhere so we needed a process  
3 to disseminate information.

4           There was a fact. The FDA needed a level  
5 structure. There is a sample up there now. Our  
6 original proposal has been up there for a while for  
7 study reports. It has been up on the ICH website  
8 next to the eCTD specification. Including that in  
9 the backbone, we couldn't get consensus in  
10 February, or even before February and we did a lot  
11 of work.

12           So the options were limited. It was the  
13 FDA will either bring this--is this an ICH topic or  
14 is it regional? If it is regional, we will go off  
15 and we will figure out the best way to do it  
16 without breaking the specification we agreed to.

17           But we wanted to keep it in ICH because we  
18 understand, the technology has a ripple effect and  
19 you can't just go off and do whatever you want. So  
20 we keep bringing it to ICH. What we found in  
21 February was that the JPMA folks had a solution  
22 that worked. We had consensus from the group as  
23 part of our change-request process. I wish I had  
24 brought the diagram, but it shows there are two  
25 different ways that a change request is deferred.

1 One is just because we didn't have the time. The  
2 other is because we need more information.

3 The study-tagging file is one of those  
4 where we need more information about it. So the  
5 FDA is implementing this study-tagging file  
6 solution in the U.S. As far as the ICH goes, we  
7 will report at each meeting but if someone wants to  
8 bring up the request, which they have, of including  
9 this information in the eCTD backbone, we will  
10 listen but I don't know if it is going to be our  
11 argument anymore because we have gone down that  
12 path already.

13 So when the other five partners are ready,  
14 then we will move to put it into the backbone. But  
15 we have given them about all the information they  
16 need. But, if you have alternative  
17 recommendations, we would love to hear them. The  
18 last thing you want to do in technology is be  
19 closed. So you can feel free to send those  
20 directly to me. And it is never too late.

21 Thank you.

22 MR. JERUSSI: Robert Jerussi from Jerussi  
23 Consulting. I have a general question, not just on  
24 the eCTD but any CTD. Since it is a voluntary  
25 submission in the United States, do you really see

1 a lot of companies submitting it? I mean, as a  
2 consultant, the question I get, should we submit an  
3 application in a CTD format. And I say, "Well, it  
4 is not required."

5 The other thing I say is it requires you  
6 to submit more information, and a lot more. A  
7 pharmaceutical development report for both the drug  
8 substance and for the drug product, a summary  
9 section which allows importation from other  
10 sections of Module 3. So those are a couple of  
11 things that are required; in other words, it is  
12 more information.

13 Why would a firm voluntarily submit that?  
14 To give you an example, there is a drug-product  
15 guidance out now. I think the comments are due by  
16 the end of this week, seven-and-a-half pages of it.  
17 14 percent is devoted to pharmaceutical development  
18 documents.

19 Why would a firm want to submit that and  
20 expose themselves to any number of questions? So I  
21 ask, am I all wet? Have I missed the boat? Is the  
22 CTD easier or does it really require more  
23 information, require companies to subject  
24 themselves to a greater scrutiny at the  
25 headquarters because development documents were

1 always required, but they were at the plant and the  
2 investigators would look at them.

3 So it is not just for you. It is for  
4 anybody.

5 MR. MAHONEY: I can, I think, tackle all  
6 of that. No; I can tackle the eCTD part of it.  
7 You haven't missed the boat but the horn is  
8 sounding on the eCTD. That is a great question;  
9 why would you do it.

10 My question is why wouldn't you? Why  
11 would you take the time to have an infrastructure  
12 that supports three different technologies in three  
13 different regions or spend the time in investing,  
14 on building a submission in an electronic format  
15 that is not consistent?

16 So, for the electronic part of the eCTD,  
17 you can develop your infrastructure. I know the  
18 FDA has pretty good IT costs. They are not  
19 skyrocketing but I know, from talking to my  
20 counterparts in PhRMA, that their IT costs are  
21 astronomical. They want the eCTD because then they  
22 build one infrastructure that supports one way to  
23 submit for INDs, ANDAs, NDAs, BLAs and the FDA as  
24 well as the other regions. So it is consistency.

25 Everything is called this, this, this and

1 this every time. So that is the benefit  
2 electronically. I will pass off the scientific  
3 contents to some of the other experts here for the  
4 answer on that one.

5 YETTER: Do we expect the industry to  
6 submit in CTD format? Yes; I think that the  
7 industry is going to. I think there are benefits  
8 to the industry. The benefits that we perceive for  
9 CBER, I think, are benefits that also pertain to  
10 the industry as well. Does the CTD actually  
11 require more information than would be required in  
12 an NDA or a BLA? Not really.

13 One of the things that you are seeing is  
14 the evolution of regulatory process. There is not  
15 more information being requested. It may be  
16 organized differently. It may not look like what  
17 you are used to seeing. But I don't believe it is  
18 really requesting more information, to a great  
19 extent.

20 We would be happy to entertain comments to  
21 that extent on any of the guidance documents that  
22 you see or even in fora like this. But, right now,  
23 we are in the process of revising some of our CMC  
24 documents to conform to CTD. We don't see  
25 ourselves increasing the amount of information we

1 are asking for.

2 We are asking you to put it in a  
3 particular place, but we are not asking you to  
4 duplicate things. In fact, if anything, this will  
5 allow us to decrease needless duplication much the  
6 way we achieved when we eliminated the  
7 establishment license application.

8 MS. MOLZON: Just to repeat what Bob said.  
9 All we are asking to be submitted is an NDA in CTD  
10 format. Dr. Jerussi knows that ICH is a joint  
11 initiative between regulators and industry and the  
12 working groups involve industry as well as  
13 regulators. Industry proposed the common technical  
14 document and had to go through a number of  
15 feasibility studies before the regulator would even  
16 take the topic up.

17 In the discussions, there is a consensus  
18 on these topics so industry is at the table  
19 negotiating these. Then, when consensus is  
20 reached, the document is published for comment and  
21 it goes through the ICH process. So industry  
22 helped develop these documents, Dr. Jerussi, so I  
23 am having a difficult time understanding why you  
24 are saying why would industry do this when they are  
25 the ones that proposed this to begin with.

1 MR. JERUSSI: I was not present at that  
2 meeting, the mid-May DIA meeting, which spoke about  
3 this business of the pharmaceutical development  
4 report. But, according to the trade press, a  
5 number of company representatives, and I don't know  
6 whether they were generic or PhRMA companies, got  
7 up and voiced strong objection to submitting that  
8 kind of information in a document.

9 So it is not just my thought. There are  
10 people in the industry who are saying, "Why does  
11 FDA want a pharmaceutical development report for  
12 the API for the drug product, which is new--this  
13 was never required in an NDA. I don't know about  
14 BLAs. Not only that, there is even more to it than  
15 that. It is the whole business of how did you  
16 develop this? What difference does it make how a  
17 company develops something as long as they  
18 developed it.

19 It has to be the drug that meets the  
20 requirements of the agency, is efficacious, is  
21 safe. It doesn't really make any difference how  
22 they developed it.

23 Now, the industry may find this but I  
24 don't know--when I was involved with ICH, the  
25 generic-drug industry was left out. They got

1 saddled with a number of requirements. Now, I know  
2 they are observers, I believe, now. But I don't  
3 know if they are really in on this. But I do get  
4 these questions.

5 MS. SHOWALTER: Actually, I think we are  
6 sort of moving from the strict CTD response to we  
7 are now sort of getting into the area that I talked  
8 about at the beginning with respect to the GMP, the  
9 drug product-quality program. So we are kind of  
10 blurring the lines a little bit here, which is okay  
11 because I think this is sort of how the discussion  
12 is evolving. But we are getting into some  
13 uncharted territory a little bit.

14 I think what Justina and Bob correctly are  
15 referring to is the fact that--and they have  
16 correctly characterized what we have done with the  
17 CTD and how it came to pass and so forth. When you  
18 start talking about pharmaceutical development, one  
19 of the things I mentioned is that is probably going  
20 to be endorsed as an ICH topic at the meeting in  
21 Brussels.

22 It really relates back to the GMP part of  
23 the ICH program. I think that the discussion is  
24 going to emerge probably along the lines that, if  
25 we are talking about implementing a quality-systems

1 approach to GMP and product quality oversight, then  
2 I think the tendency is going to be that we are  
3 going to have to have additional data going into  
4 that to understand that a quality-system approach  
5 is in place.

6           So now you are sort of moving into this  
7 other conversation about assurance. It really  
8 doesn't have much to do with the CTD except if we  
9 make some changes in terms of taking on the  
10 pharmaceutical development and what the different  
11 requirements are in the various regions. That, of  
12 course, will impact, potentially, the CTD down the  
13 road. So it could be that there will be other  
14 additional requirements. There will be other ICH  
15 topics that may have to be reopened and looked at.

16           So things will be potentially revisited.  
17 Will this lead to some additional requirements?  
18 Perhaps, but I think a part of it is a little bit  
19 of a balancing act. If we are looking more in  
20 terms of information transfer and what we see, a  
21 lot of that reassurance that is going to come  
22 front-end versus what we do on the inspection side  
23 and how the two relate together, all of that has to  
24 be worked out.

25           I don't think anybody can predict right

1 now what that is going to do overall to whatever  
2 requirements, whatever guidelines, et cetera, may  
3 well be in place. We would all just be  
4 speculating at that point.

5 In terms of the narrow scope of the  
6 question and what is in the CTD, I think that part  
7 has been answered very accurately and correctly.  
8 Then you segue into things that are somewhat  
9 unknown at this point that have a lot to do with  
10 pharmaceutical development, with what additional  
11 things might be required in support of a GMP  
12 drug-product-quality approach that really is more  
13 of a quality-systems, risk-management,  
14 risk-assessment type of approach.

15 That is sort of the long answer, but you  
16 are right on target with where the thinking is  
17 tending to evolve. Of course, comments are very  
18 welcome in that area.

19 MR. MILLER: Loren Miller, PPD. I was  
20 interested in one slide that was presented where it  
21 was stated that the Common Technical Document was  
22 not considered a global dossier. I am not so sure  
23 industry didn't expect that, though, at the  
24 beginning when all this started out, that  
25 potentially a global dossier was possible.

1           In fact, I remember when all this started  
2 that, in fact, many people in regulatory affairs  
3 had that expectation. I seems to me, though, that  
4 with all the different modules and all the add-ons  
5 required by different countries, and a good example  
6 is the ISE-ISS controversy within FDA relative to  
7 what the document outlines now.

8           If you have ever had to write up one of  
9 these things and then you have to write it up two  
10 or three different ways for different countries, it  
11 is complicated. It is about as complicated as  
12 filing independent applications. So I think  
13 industry is hopeful that there would be some  
14 advantage on the harmonization side so that  
15 wouldn't need to be done.

16           MS. SHOWALTER: I am not sure there really  
17 is a response to that, but the only thing that I  
18 would say is that when the initiative was  
19 undertaken, I think that the regulatory authorities  
20 realized the challenges that would be involved, and  
21 that is why we did spend a number of years in the  
22 feasibility phase because it is a little more  
23 complicated than to just say it is strictly a  
24 format because we also understood that the way that  
25 the format got constructed has an impact on the

1 content as well and the way that the application is  
2 separated and reviewed within a regulatory  
3 authority, et cetera.

4           So I think we do understand that it is  
5 more complicated than that. I think we also  
6 understand the goal, ultimately, might be to have  
7 something that is more akin to a global dossier.  
8 But we have got to start somewhere. All the  
9 comments that I have heard, basically, are that  
10 this is a pretty good starting point.

11           With a little ability to undertake those  
12 challenges, you can, at least, submit a package  
13 that works in each of the regions. Part of the  
14 feasibility study at the beginning was that we knew  
15 companies were already doing this as well. There  
16 have been some test cases where they didn't say  
17 they were doing that, but, at various DIA meetings  
18 and so forth, companies would get up and report on  
19 the fact that they had achieved success already in  
20 doing this.

21           So I think all we can say right now is  
22 that it is a reasonable starting point. It is a  
23 good thing, conceivably, for the industry, also for  
24 the regulatory authority, to have some sort of  
25 standard format to look at. It kind of takes you

1 into the next wave of doing templates for reviewers  
2 and things where I think everybody agrees there is  
3 a lot more consistency.

4 So it is an evolving art form, I think it  
5 is fair to say.

6 Thank you, Tim. In order to get us back  
7 on schedule a little bit for some of the people who  
8 are here from the outside, I think what I would  
9 like to do, Justina, with your permission, is move  
10 the QT prolongation to the end so we could pick up,  
11 after Helle Gawrylewski's presentation, with the  
12 pharmacovigilance section.

13 The meeting allows the opportunity for  
14 outside speakers. We did have a request for an  
15 outside talk. This will be provided by a  
16 representative of a DIA committee that looks at the  
17 work that is being done on the CTD. I will let  
18 them introduce themselves and provide the  
19 presentation.

20 **Presentation**

21 MS. GAWRYLEWSKI: Good morning. My name  
22 is Helle Gawrylewski. I am Co-Chairman of the Drug  
23 Information Association's Medical Writing Special  
24 Interest Community, SIAC, Standards Subcommittee.  
25 With me is Barbara Kamm and also Sandy Heckler.

1 Barbara is Medical Writing Projects Manager at  
2 Allogan, but our comments do not reflect any  
3 official opinion of our respective companies or  
4 affiliates.

5           We are here on behalf of the DIA Medical  
6 Writing SIAC Standards Subcommittee and our basing  
7 these comments on several surveys, a roundtable  
8 discussion and several other team meetings within  
9 our group. We discovered that there are some  
10 misunderstandings about the ICH E3 Guidance on the  
11 format and content of clinical-study reports. So  
12 we recommend that the ICH Steering Committee  
13 consider reopening the guidance for some  
14 clarification and refinement.

15           Since its inception in 1990, various ICH  
16 working groups have successfully harmonized over 50  
17 guidances that have measurably instituted  
18 time-saving and cost-saving effects on drug  
19 development.

20           The ICH E3 Guidance was one of the first  
21 major efforts to harmonize the very building block  
22 of a drug submission or marketing application in  
23 U.S., Europe and Japan. This particular working  
24 group should be commended for completing this  
25 difficult task because the spirit of global

1 harmonization is a commitment we see widely  
2 supported today but that was not the case at the  
3 time this guidance was developed.

4           We are not requesting major changes or  
5 revisions but recent developments motivate the  
6 request for refinements. Specifically  
7 good-guidance practices are in place now and we  
8 request that the E3 guidance be evaluated for  
9 consistency and clarity and also because of the  
10 eCTD standards that DTT and the study report  
11 tagging system proposed by the FDA has caused some  
12 confusion, although I have not seen the details  
13 specifically on the website, we have heard some of  
14 the details.

15           So, in our surveys and questioning, we  
16 found that the writers in the pharmaceutical  
17 industry, whether working for large or small PhRMA  
18 or independent for CROs can interpret the guidance  
19 section numbering in two very different ways. Some  
20 consider the numbering to be a template to be  
21 followed exactly while others consider the  
22 numbering system to be simply that of the guidance  
23 and not applicable to the CSR, which is the  
24 clinical study report.

25           Internal QA auditors are also interpreting

1 the guidance numbering and section content  
2 literally and they interpret it almost carrying to  
3 weight of law even though the level of flexibility  
4 is clearly discussed in the introduction of the E3.  
5 The message really isn't getting through.

6           Thus, we recommend a clarifying statement  
7 be issued about the extent to which these numbers  
8 should be followed and we recommend flexibility in  
9 the numbering scheme as long as the elements are  
10 present.

11           According to the ECD-CTD study report  
12 granularity document, apparently the appendix  
13 numbers are recommended to be exactly the numbers  
14 used in the E3 guidance as file names; for example,  
15 16.1, 16.1.1 and 16.1.2. We recommend a simpler  
16 system of sequential numbering, 1, 2, 3, 4, 5, 6.  
17 There is really no need to consider the appendices  
18 as part of the report document. The separate  
19 granules that are recommended now are the synopsis,  
20 the report body and we are also recommending a  
21 separate granule for the study-supporting  
22 documents, the summary tables and the listing  
23 because these are generated by SAS. Then each  
24 appendix has a separate file, a separate tagging  
25 file after that.

1           Also some optional appendices should be  
2 allowed for unforeseen special reports. I know  
3 that the numbering, once it becomes specified in  
4 the eCTD, will be unchangeable so we are concerned  
5 about that being the case.

6           Other issues to address with the E3  
7 guidance is the need to include some explanatory  
8 information about the contents of the recommended  
9 appendices and the inclusion of a location for data  
10 not mentioned specifically in the guidance at this  
11 time; for example, pharmacoeconomics, health  
12 outcomes and pharmacogenetics and genomics. These  
13 are new and increasingly included as endpoints in  
14 studies, yet they do not have a specific location  
15 in the CSRs.

16           Some types of information are mentioned in  
17 several sections and this could lead to some  
18 duplication, so we would recommend, for example,  
19 that statistical methods and statistical issues be  
20 placed together in a single section. Right now,  
21 they are spread in multiple sections.

22           For signatures and approvals, it should be  
23 possible to incorporate the sponsor's medical  
24 officer signature in a report appendix and  
25 hyperlink to signatures required regionally in

1 Module 1 or place all signatures in Module 1 with  
2 just a placeholder in CRSSs. More clarity on this  
3 issue and in the CTD recommendations would be  
4 welcome.

5 the final point is that if essential  
6 documents are maintained in the trial masterfile  
7 according to GCP recommendations and are available  
8 at all times for reference if requested, what would  
9 be the streamlined list of documents essential for  
10 review and interpretation of study data.

11 For example, one appendix requires  
12 documentation of interlaboratory standardization  
13 methods and quality-assurance procedures. Some  
14 companies have interpreted this to mean inclusion  
15 of all laboratory manuals for routine laboratory  
16 tests.

17 For accredited laboratories, this  
18 represents an extra cost in resources, both human  
19 and paper, in scanning the voluminous documents  
20 that this would entail, documents that a reviewer  
21 might not need and might not even want. So, in an  
22 effort to supply what the reviewers do need and to  
23 avoid the extra costs in time for industry, could  
24 more explanatory texts be added to the required  
25 appendices and some appendices actually deleted

1 altogether if the data have not proven useful.

2           This would be an ideal time to review that  
3 because, once these eCTD specifications go into  
4 effect, these appendices are there forever and if  
5 there is unclarity about the content of these  
6 appendices, it will lead to some difficulties later  
7 on.

8           According to Commissioner McClellan's  
9 recent statements at the DIA conference, we need to  
10 perform efficient global risk management, provide  
11 clear guidances and use the best science available  
12 for creating a standard set of rules to reach our  
13 policy goals in the least burdensome way. Large  
14 PhRMA has had the experience to use this  
15 least-burdensome approach but smaller companies are  
16 struggling.

17           So the details of some minor issues that  
18 might add to the clarity of this valuable document  
19 will be provided for the record as a starting point  
20 for consideration. I have some details but I don't  
21 want to read all of that into the record now.

22           In conclusion, our recommendations for  
23 reevaluation of the ICH E3 guidance include the  
24 structure and numbering of sections, specific  
25 guidance on the contents of the key appendices,

1 duplication of information in more than one  
2 section, eliminating that and adding some missing  
3 locations for other types of information, and  
4 clarity on signatures and placement options for  
5 signatures.

6 A Q&A area on the ICH website with  
7 harmonized responses and clarifications similar to  
8 the CTD Q&A area would work well for some of the  
9 more minor areas.

10 Respectfully, Helle Gawrylewski and  
11 Barbara Kamm. Thanks very much for listening.

12 MS. SHOWALTER: Thank you.

13 We are quite a ways behind schedule, I  
14 understand. If we could do a little bit of a  
15 shifting of the agenda and take up the  
16 pharmacovigilance topics next. The first speaker  
17 under that section would be to talk about MedDRA  
18 MSSO and then we will proceed with E2D after that,  
19 E2E, and then we will come back to E14, a Q-T  
20 prolongation topic.

21 **Pharmacovigilance**

22 **MedDRA**

23 MR. REVELLE: First I would like to thank  
24 the FDA for inviting us here to speak. It is a  
25 good opportunity, I think, for us to at least give

1 a little update on MedDRA and about some of the  
2 activities that we are going forward with.

3 I will give a little bit of an intro about  
4 MedDRA so you will get a sense of what I am talking  
5 about but I think MedDRA actually represents a ICH  
6 success story. It has come through the whole ICH  
7 process out of the M1 Expert Working Group and is  
8 now actually in wide use in the pharmaceutical  
9 industry. I will talk a little more about some of  
10 the other related sort of issues.

11 So what are the objectives of MedDRA? It  
12 is to provide an international multilingual medical  
13 terminology really to be used across the full  
14 spectrum, from clinical-trial drug development  
15 through postmarket reporting. The real goal, I  
16 think, or one of the several goals is to have  
17 standardized communication not only just from  
18 industry to regulators but between industry,  
19 themselves. They have actually found it to be very  
20 useful tool, especially during this consolidation  
21 period within industry, itself.

22 MedDRA has a pretty wide scope and it is  
23 fairly different than some of the terminologies  
24 that we are replacing. It goes, obviously, across  
25 adverse events, but medical history, physician

1 examinations, medical and surgical procedures,  
2 laboratory tests, just to give you the sense of the  
3 spectrum.

4 In fact, I think this next slide is the  
5 listing of all of the top-level what we call  
6 system-organ classes in MedDRA to give a sense of  
7 the scope of the areas covered within the medical  
8 terminology.

9 I work for an organization called the  
10 MedDRA Maintenance and Support Services  
11 Organization which is really tasked to do a couple  
12 of different things, the first of which is to  
13 maintain and continue the development of MedDRA  
14 through an international change-request process.  
15 So, as you subscribe to MedDRA, you have the rights  
16 to be able to submit change requests and then you  
17 receive MedDRA on a twice-a-year basis at this  
18 point.

19 Our other goal is, obviously, to foster  
20 MedDRA use worldwide through communication,  
21 education and some services that we provide.

22 That is a very quick introduction to  
23 MedDRA and, hopefully, it filled in a little bit of  
24 gaps for you if you have those. I am going to talk  
25 about a couple of different issues that are

1 significant, at least in the MedDRA world right  
2 now. We started a process called a MedDRA  
3 blue-ribbon panel. As you may be aware, MedDRA, or  
4 the MSSO, started the maintenance of MedDRA in  
5 November of 1998.

6           Initially, the process of maintenance was  
7 relatively simple because, while MedDRA was very  
8 well-developed by the time we got it, there were  
9 still some areas that needed some work. So, to  
10 fill those holes, at that point in time, was  
11 relatively simple.

12           More recently, the task of maintenance has  
13 been more complex and the number and the types of  
14 changes that we are getting are much more granular  
15 and much more fine in their distinction between  
16 existing terms. We are also trying to balance  
17 between the development and the growth of the  
18 terminology versus the value of that growth to the  
19 subscribers and users of the terminology.

20           So, as a part of that, we are trying to  
21 implore the users to provide more rationale for  
22 changes so we don't just automatically include  
23 every change that we receive.

24           To aid in this process, we have worked  
25 with our management board which consists of both

1 regulators and industry to come up with this  
2 concept of the blue-ribbon panel to give us  
3 additional input for guidance and policy regarding  
4 the types of changes we should consider and  
5 continue to consider for MedDRA.

6           So we talked about things regarding the  
7 general scope and specificity of MedDRA as well as  
8 to support the consistency of maintenance  
9 activities. Quite honestly, our biggest concern is  
10 to make sure that we are consistent in what we  
11 include or exclude through the life of the  
12 maintenance of MedDRA.

13           The panelists reflected the makeup of the  
14 ICH so we had regulators as a part of the panel as  
15 well as industry representatives. We also included  
16 our subscribers as observers and, actually, they  
17 are really participants in the panel through  
18 questions and answers.

19           The end result of this panel is for them  
20 to develop with really our assistance a series of  
21 recommendations that will provide to our management  
22 board before we will make them public, but the idea  
23 is, again, to refocus the efforts of the MSSO to  
24 make sure it is consistent with what the user  
25 community is looking for. After we get our

1 management board approval about those  
2 recommendations, we will publish them on the MSSO  
3 website and, obviously, make it available to all of  
4 the users of MedDRA.

5 We thought it was a great success,  
6 actually, for us to hold this blue-ribbon panel.  
7 We thought the format worked very well. So, as a  
8 result, we actually plan on continuing to have  
9 these blue-ribbon panels on other MedDRA-related  
10 topics and right now we are talking about about two  
11 per year.

12 Another sort of an interest area in MedDRA  
13 is MedDRA is not only available, obviously, in  
14 English but part of our task is to maintain it in  
15 multiple languages. From the outset, MedDRA, from  
16 its earliest version that was delivered, Version  
17 2.1, was available in English and in Japanese.

18 Through the series of different releases,  
19 there have been other languages added including  
20 Spanish through the lowest level term level, which  
21 is the lowest level of detail in MedDRA. Other  
22 languages, like French, German, Portuguese have  
23 been translated but only through the preferred term  
24 level of MedDRA which is the next level up of  
25 detail, the lowest-level term, which I will get

1 into, is somewhat problematic for some of the  
2 languages. Dutch is scheduled for release in  
3 September of 2003.

4 One of the true values that we saw in even  
5 the developers of MedDRA and the M1 Expert Working  
6 Group saw was that each MedDRA term is assigned a  
7 unique MedDRA code so there is a possibility that  
8 you could code in one particular language and  
9 output in another based on the linkages of those  
10 codes. That works today. I will talk about some  
11 issues related to the translations next.

12 Typically what it revolves around is the  
13 lowest-level term which tends to have some  
14 synonyms, some colloquial terms especially in  
15 English. I make an example here of edema, edema  
16 spelled both ways. MedDRA incorporates the English  
17 version, both the North American version of English  
18 that I speak as well as the British English that is  
19 spoken across the way.

20 Obviously, that poses a question when you  
21 are performing translations, is how do you  
22 translate that to Spanish. How do you translate  
23 that to Japanese? Right now, unfortunately, some  
24 of the languages are handling that differently. So  
25 we are considering that as a potential next topic

1 for a blue-ribbon panel because it could destroy  
2 some of the utility if we don't maintain a  
3 reasonable link of the translations between the  
4 different languages.

5           One of the other major topics that we are  
6 working on is some efforts to coordinate our MedDRA  
7 maintenance with a CIOMS group that, interestingly  
8 enough, had independently come to the same  
9 conclusion that we had which MedDRA had gotten a  
10 wide acceptance and wide implementation for the  
11 codification of clinical-trial data or just  
12 clinical data in general.

13           But, to extract data once it has been  
14 coded in MedDRA was starting to become somewhat of  
15 a more difficult task. So both the CIOMS group and  
16 the MSSO initiated two separate activities to try  
17 to address this. The CIOMS group started to  
18 develop a product called the standardized search  
19 queries and the MSSO was developing something  
20 called MedDRA Analytical Groupings.

21           We started to notice that both of us were  
22 working on the same thing and thought it might be  
23 better if we combined our efforts. So what we have  
24 done is we now are working together on a single  
25 working group to develop what are--of course, we

1 had to come with a new acronym, our standardized  
2 MedDRA queries.

3           During that process, we have held a series  
4 of different meetings to try to coordinate our  
5 efforts. They have developed a series of different  
6 SSQs. We developed a series of MAGs. We want to  
7 consolidate that effort.

8           To give you a little bit more sense of  
9 what I might be talking about is an SMQ is a group  
10 of MedDRA terms that relate to a defined medical  
11 condition or area of interest. So it combines,  
12 say, the laboratory test, the diagnostic, the signs  
13 and symptoms all related to a very specific issue  
14 that you might be looking for.

15           Then you could use that as kind of a  
16 stored query to go against your data to try to pull  
17 the cases of interest and make it a little more  
18 useful for you.

19           Just to give you a sense of where we are  
20 going, you will see what are generally considered  
21 to be very interesting topics especially from the  
22 safety side, to be able to develop what are the  
23 terms in MedDRA that are relevant to these  
24 particular SMQs and then define that, distribute  
25 that to the users of MedDRA so they can start using

1 that as a tool against their own database.

2 They could also use it as a tool for  
3 communication against their own database. They  
4 could also use it as a tool for communication  
5 amongst themselves and we think eventually to  
6 regulators as well. I might make a note that a  
7 regulator is including the FDA, EMEA and others,  
8 who are all involved in the development of these  
9 SMQs and are very much interested in the outcome  
10 and the eventual product coming to fruition.

11 You might notice that there are four of  
12 the SMQs that are asterisked. They will be coming  
13 out in the next version of MedDRA which is  
14 scheduled for release in September of this year.

15 I will give you a little bit more of our  
16 plans for the SMQs. It is a two-year collaborative  
17 process that we have in mind right now with the  
18 CIOMS group. Obviously, MedDRA or the MSSO would  
19 continue to maintain these SMQs after that point,  
20 but at least this intensive effort with CIOMS would  
21 continue for the next two years.

22 IFPMA would own the rights to these SMQs  
23 as they do with the rest of MedDRA. The MSSO will  
24 maintain and distribute with each MedDRA release  
25 so, as things change in MedDRA, we will either add

1 new terms to an SMQ or, potentially, remove them.  
2 It is part of a standard MedDRA subscription so  
3 there is no additional cost associated with.

4 Obviously, we need to develop additional  
5 documentation to make sure users of MedDRA will  
6 have some sense about what we are talking about.

7 I mentioned before that the first set of  
8 SMQs will be scheduled for release this September.  
9 It will be part of the MSSOs change-request process  
10 so that the subscribers to MedDRA could also either  
11 identify additional SMQs to be developed or  
12 recommend changes for existing SMQs.

13 With that, I will take any questions you  
14 have regarding MedDRA.

15 MS. SHOWALTER: Thank you. Questions?

16 MS. GAWRYLEWSKI: I have one quick  
17 question. Being part of industry, there is a heavy  
18 mention of industry involvement and regulator  
19 involvement. I am just assuming, and this is  
20 probably a really naive, stupid question, that  
21 practicing physicians in the private sector are  
22 also involved in developing this. It is not really  
23 mentioned very often or well-known. How are they  
24 involved, actually practicing physicians.

25 MR. REVELLE: MedDRA is actually available

1 through the GPRD which, I think, is a U.K.-based  
2 group that is trying to make terminologies  
3 available to regular practicing physicians. So we  
4 are looking at other groups to try to get MedDRA  
5 down to that level as well so they are not excluded  
6 from the process.

7 The initial development, obviously, was  
8 for the pharmaceutical and biotechnology industry.  
9 But it is, I think, within our scope or at least in  
10 our intent to try to serve them as well.

11 MS. SHOWALTER: Thank you.

12 Now we will move on to the next talk which  
13 is Susan Lu is going to bring us up to date on E2D.  
14 That would be post-approval safety-data management.

15 **E2D: Post Approval Safety Data Management**

16 MS. LU: ICH E2D is a guideline of  
17 post-approval safety-data management and provides  
18 standard definitions and terms for key aspects of  
19 expedited reporting. This guidance is intended to  
20 help harmonize methods for gathering and evaluating  
21 safety data.

22 This topic was adopted by ICH in February,  
23 2002 and the working group has met previously three  
24 times since June of 2002. The former name for this  
25 guideline was V2, the second of three

1 pharmacovigilance topics but, at the February  
2 meeting, the ICH Steering Committee renamed it E2D.  
3 The current status E2D is Step 1; that is, building  
4 consensus through discussions between regulators  
5 and industry for harmonization of concepts in  
6 postmarketing safety.

7           E2D is an expansion of an existing E2A  
8 guidance which set standards for clinical-safety  
9 data management. E2D is similar in style and  
10 content to E2A and considers how those concepts can  
11 be applied to the postapproval phase. Relevant  
12 concepts and recommendations from the CIOMS-5  
13 report on pharmacovigilance would be incorporated  
14 into this guideline.

15           The title of the first three sections of  
16 the guideline are identical to those in E2A. There  
17 is a short introduction, a section on definitions  
18 and terminology associated with postapproval  
19 drug-safety experience and standards for expedited  
20 reporting.

21           A fourth section on good case-management  
22 practice is a topic originating from CIOMS-5. The  
23 introduction section states the purpose of the  
24 guideline which is to establish an internationally  
25 standardized procedure in order to improve the

1 quality of postapproval safety information, to  
2 harmonize the way to gather and report information.  
3 This guideline is based on concepts from E2A and  
4 although E2A standards and definitions have been  
5 applied by regulators and industry, there is a need  
6 to formalize this. Also, there is a need for  
7 definitions that are specific to the postapproval  
8 phase.

9           The second section of the guideline is the  
10 definitions and terminology for postapproval  
11 drug-safety experience. This includes basic  
12 terminology, formally defined in E2A such as an  
13 adverse event, an adverse drug reaction. The  
14 criteria for seriousness and expectedness is also  
15 discussed. There are also new definitions that are  
16 not in E2A such as labelness, which refers to local  
17 product labeling, and listedness, which refers to  
18 the core-company datasheet.

19           Class ADRs is also addressed in the  
20 premise that these are not automatically considered  
21 expected unless the labeling describes an event as  
22 occurring specifically with the product.

23           Other definitions such as healthcare  
24 professionals and consumers, we really don't  
25 address these in U.S. regs but the working group

1 felt that these are important to include because,  
2 outside of the U.S., these reports are not  
3 considered valid unless there is confirmation by a  
4 healthcare professional.

5           There is also an extensive section within  
6 the definitions and terminology that describes the  
7 sources of individual case reports. Most of these  
8 are described in the CIOMS-5 report.

9           The third section of the guidance is  
10 standards for expedited reporting which addresses  
11 what should be reported. It states that single  
12 cases of serious unexpected adverse events is  
13 always subjected to expedited reporting. It also  
14 does describe some other cases such as lack of  
15 effect. These are generally not subject to  
16 expediting reporting except in certain  
17 circumstances where there is an exacerbation of  
18 disease or the product is used in the treatment of  
19 life-threatening disease.

20           Drug-dependence type reports are also  
21 addressed and these are events that may qualify for  
22 expedited reporting of not associated with further  
23 adverse events unless it is described in the  
24 product labeling. In contrast, reports of overdose  
25 with no associated adverse outcome should not be

1 reported as adverse drug reactions.

2           Reporting time frames are also addressed  
3 in this section. The minimum criteria for  
4 reporting is the minimum dataset that consists of  
5 an identifiable patient, an identifiable reporter,  
6 a suspect product and an adverse event. The time  
7 clock start point is defined as the date when a  
8 company first receives a report that fulfills the  
9 minimum criteria for reporting.

10           The last section of the guideline is good  
11 case-management practices which stresses the need  
12 for accurate and complete information to identify  
13 and assess adverse drug-reaction reports. The five  
14 topics in this section are assessing patient and  
15 reporter identifiability, the role of narratives,  
16 single case evaluation, follow-up information and  
17 how to report.

18           Assessing patient and reporter  
19 identifiability is important to verify the  
20 existence of a real patient reported. Identifiers  
21 would include patients initials, code, sex, age,  
22 category, name and phone number of the reporter.  
23 Establishing identifiability minimizes case  
24 duplication and this facilitates a follow-up of  
25 individual cases.

1           The role of narrative sections states that  
2 a narrative of a case report should summarize all  
3 the relevant clinical information including the  
4 patient characteristics, therapy details, medical  
5 history, clinical course of the event including  
6 outcome, laboratory data and any other information  
7 that would support or refute the evidence or  
8 diagnosis for an adverse drug reaction.

9           It also states that an autopsy should be  
10 provided when available and ICH E2B establishes  
11 that company narratives are required for all  
12 reports of serious reactions.

13           The single case evaluation section  
14 proposes review for correct interpretation of  
15 medical information and for quality and  
16 completeness of information. This also emphasizes  
17 the need for sound clinical review.

18           The follow-up section stipulates that the  
19 highest priority for follow up is for cases of  
20 serious unexpected events. The use of a focused  
21 line of questioning such as a questionnaire is  
22 encouraged to capture clinically relevant and  
23 important information and follow up is suggested to  
24 be performed by healthcare professionals with  
25 pharmacovigilance training.

1           Our goal in this working group is to  
2 ensure that the contents and concepts are  
3 consistent with current-use regs and guidances and  
4 with the safety-reporting proposed rule. As I  
5 mentioned earlier, the working group is in Step 1  
6 which is consensus building and there may be  
7 further changes. There are still issues,  
8 particularly in the definitions and terminology  
9 section and, to a lesser extent, in the expedited  
10 reporting section which will require further  
11 discussion.

12           Looking ahead, there may be additional  
13 topics to consider for incorporation into E2D.  
14 Some examples of these would include issues such as  
15 medication errors, the concept of requiring full  
16 datasets for all serious adverse drug reactions,  
17 always expedited reports and requiring full  
18 documentation for reports of death and  
19 hospitalization.

20           Any questions? Thanks.

21           MS. SHOWALTER: Thank you, Susan.

22           The next-to-last topic that we have is  
23 E2E, pharmacovigilance planning. Paul Seligman is  
24 going to do that topic for us--if he is here he  
25 will, anyway. But if he is not here, and he

1 doesn't seem to be at the moment, Justina why don't  
2 you do QT prolongation and then we will come back  
3 to that one.

4 **E14-Clinical Part of QT Prolongation**

5 MS. MOLZON: I need to start this  
6 presentation with a disclaimer. I am here  
7 pinch-hitting for Dr. Douglas Throckmorton, the  
8 Division Director for Cardioresenal. He is actually  
9 the rapporteur for this group and this group is the  
10 newest expert working group, so we thought it would  
11 be a good idea just to fill you in on what has been  
12 going on and the plans for Brussels.

13 The point of this whole topic which deals  
14 with the clinical evaluation of QT-interval  
15 prolongation and proarrhythmic potential for  
16 non-antiarrhythmic drugs is that that is a concern  
17 about drug-induced proarrhythmias. The goal of the  
18 documents that are being discussed in this expert  
19 working group is to provide recommendations to drug  
20 developers concerning the design, conduct and  
21 interpretation of clinical studies to assess the  
22 potential for delaying cardiac repolarization.

23 Currently, in ICH, we have a pharm-tox or  
24 safety topic called S7B which looks at the safety  
25 pharmacology studies for assessing the potential

1 for delayed ventricular repolarization or  
2 QT-interval prolongation by human pharmaceuticals.  
3 So this is the pharm-tox or non-clinical aspect of  
4 the clinical document that is under way.

5 This safety document was released for  
6 consultation under Step 2 of the ICH process in  
7 February of 2002. It was published in the Federal  
8 Register. Notice of its being released for  
9 consultation was in the Federal Register in June of  
10 2002. Then we sort of held it at this point  
11 because we were waiting for the clinical document  
12 to develop so the two can proceed at the same time.

13 So the safety pharmacology people are  
14 actually gathering information to help feed into  
15 the clinical document.

16 Now, there is some additional background  
17 to this ICH topic. It started with a document that  
18 was drafted by Canada's Therapeutic Products  
19 Directorate. I believe that this was in response  
20 to a coroner's inquiry into some of the products  
21 that were causing QT prolongation which resulted in  
22 several deaths in Canada.

23 CDER was working on a similar document  
24 because we had similar concerns and we recognized  
25 the value of a joint effort and, further, the

1 effort of a harmonized ICH document. So we talked  
2 about introducing this topic into the ICH process  
3 which is unusual because, generally, industry  
4 proposes topics. But here this was a regulatory  
5 concern and the regulators wanted to introduce the  
6 topic. But the regulators recognized the need for  
7 expertise outside of the ICH process.

8 Just to talk about some time lines; Health  
9 Canada came out with a draft guidance document on  
10 QT-interval prolongation in March of 2001. That  
11 document was combined with FDA efforts and a  
12 proposed concept paper was put together in November  
13 of 2002.

14 We then developed a consultation workshop  
15 held here in Washington, D.C. in January of 2003.  
16 What we were trying to do with this consultation  
17 process was to sort of jump-start the ICH process  
18 by using a draft or final document that was being  
19 developed in one of the ICH regions that would  
20 provide a strong foundation for the development of  
21 an ICH guideline.

22 So, instead of having a very brief concept  
23 paper being introduced into the ICH process, you  
24 have a fairly well-developed document to start the  
25 ICH process. This more developed document would

1 ensure the inclusion of the necessary experts  
2 outside of the ICH process. So the idea here was  
3 to involve the people with necessary expertise that  
4 would not be necessarily part of the ICH working  
5 group.

6           So, to develop or to enable inclusion of  
7 this specific medical expertise, the preliminary  
8 concept paper that the FDA and Canada's Therapeutic  
9 Products Directorate worked on was posted in the  
10 DIA, the ICH, the TPD and CDER websites on the same  
11 day, November 20 of 2002. This was so that  
12 everybody that was interested in the document could  
13 read it before we had discussions in a DIA meeting  
14 where we invited experts outside of the ICH process  
15 for a very scientific discussion.

16           So we worked with the North American  
17 Society of Pacing and Electrophysiology to make  
18 sure the correct expertise was included in this  
19 discussion process. And the ICH working group for  
20 S7B plus this newly established group on QT  
21 prolongation was present for the discussion so they  
22 could listen to the scientific discussion and then  
23 take those thoughts back into the ICH process.

24           This was a bit of a different approach for  
25 all of us because it is outside the norm for the

1 regular guideline development within ICH, CDER and  
2 TPD. It was also a different venue and process for  
3 the Drug Information Association because this was  
4 very academic setting to provoke academic  
5 discussion. This was a meeting that took place at  
6 the University of Maryland at Shady Grove, so it  
7 wasn't a hotel. It was just an academic huge  
8 conference room.

9 More than twice the number of panelists  
10 were on the program. We must have had twenty to  
11 thirty panelists so that we had a wide variety of  
12 expertise from a wide variety of settings;  
13 academia, hospitals, clinics, CROs, et cetera. It  
14 ended up being one of the largest programs outside  
15 of the Annual Meeting for DIA, with over 620 people  
16 attending.

17 To capture all of the effort at this  
18 workshop, there was a transcript to capture the  
19 discussion and the resulting recommendations and  
20 conclusions were incorporated into the document  
21 that had been posted for consideration. The  
22 recommendations and conclusions from the workshop  
23 were incorporated into the document for ICH  
24 consideration.

25 This document was fed into the ICH QT

1 Prolongation Working Group during the meetings in  
2 Tokyo this past February. The result is,  
3 hopefully, going to be a harmonized approach to QT  
4 prolongation.

5 Now, the following slides are from Dr.  
6 Doug Throckmorton and they represent his report to  
7 the ICH Steering Committee at the meetings in  
8 Chiba, Japan in February of 2002. Basically, he  
9 just provided an outline of the guideline. The  
10 guideline, I believe, has seven sections;  
11 background and scope, clinical-trial design--that  
12 includes Phase I through evaluation, Phase II and  
13 III evaluation. Section 3 is a collection and  
14 analysis of QT-interval data. Section 4, analysis  
15 of QT interval and ECG wave-form data. Section 5,  
16 adverse-experience collection. Section 6,  
17 regulatory implications, labeling and risk  
18 management. So I mis-spoke. There are only six  
19 sections.

20 Dr. Throckmorton talked about progress of  
21 the working group at those meetings in Japan.  
22 There was an initial discussion and revision of the  
23 document, so this is the document that came out of  
24 the workshop that was put on before the ICH  
25 meeting.

1           There was an identification of items  
2 requiring additional data or discussions such as  
3 operating characteristics of nonclinical assay  
4 systems. So this is where the S7B group fits in,  
5 and the potential use of nonclinical data to inform  
6 design of a thorough clinical QT study.

7           So, how can you use the nonclinical,  
8 preclinical or animal data to support what needs to  
9 be done or not be done in the clinical studies.  
10 Trial-design issues were also discussed and this  
11 included validation of Phase I study assay  
12 sensitivity, use of data from thorough Phase I  
13 assessment and to inform Phase II and III trials.

14           The action items that were presented to  
15 the steering committee was there was, believe it or  
16 not, a huge controversy about what to call this  
17 topic. Logistically, it should have been E13 but,  
18 for some reason, in this very scientific forum,  
19 that was not acceptable. So it is now E14 skipping  
20 E13.

21           Also the working group edited the version  
22 of the concept paper for presentation by the  
23 steering committee and they discussed the clinical  
24 research necessary to parallel the S7B research  
25 initiative. There was the possibility of an

1 interim meeting or teleconference following the  
2 availability of nonclinical data from the S7B  
3 working group.

4 I don't believe that actually took place  
5 because it wasn't necessary, but it had been  
6 proposed.

7 Las month, in CDER, the Cardiovascular and  
8 Renal Drugs Advisory Committee held a two-day  
9 meeting on nonclinical studies and their  
10 sensitivity and specificity. The potential impact  
11 of nonclinical testing on the design of the  
12 thorough clinical QT evaluation will be discussed  
13 in Brussels. So we are also using some of the  
14 information from this recent advisory committee to  
15 feed into the Brussels discussion.

16 The goal in Brussels is to reach a Step 2,  
17 so that would be a document that would be put out  
18 for comment. So, once again, the document will be  
19 available for anyone to comment on and I believe  
20 that this is a very short turnaround for an ICH  
21 document. So, by jumpstarting the ICH process and  
22 putting a lot of expertise or whatever into the  
23 document initially, you can actually speed up the  
24 ICH process.

25 I think that is it. Any questions should

1 go to Dr. Throckmorton but I would be pleased to  
2 pass them on. Does anyone have any questions?

3 MR. PARKER: Ford Parker from Hoffman  
4 LaRoche. One thing we were surprised to see in the  
5 document was, at the DIA meeting, people were very  
6 opposed, including people that do a lot of these  
7 ECG studies like Joel Morganroth that the document  
8 included requiring detecting a mean QTC change of 5  
9 milliseconds, which he said was nearly impossible  
10 and our calculations, from the standard deviations  
11 that you typically see in healthy volunteers, is  
12 about 12 to 14 milliseconds for QTC, would require  
13 upwards of 100 subjects per arm.

14 In addition to that, you also recommend  
15 using moxifloxacin as a control which causes  
16 changes of 5 to 10 milliseconds which, supposedly,  
17 the agency thinks is inconsequential clinically.  
18 So the question is why would you expect people to  
19 detect 5 milliseconds in a 500-subject study where  
20 you don't believe these changes are even clinically  
21 meaningful.

22 MS. MOLZON: First of all, I don't know if  
23 that information is actually still in the document  
24 because, as I said, recommendations from the DIA  
25 workshop were used to revise the document that went

1 into the ICH process.

2 MR. PARKER: It was in the February 6  
3 document after the DIA meeting. It was still  
4 there, 5 to 6 milliseconds.

5 MS. MOLZON: Okay. I am not the expert  
6 here. But I still don't know if that information  
7 was rediscussed in Chiba, Japan and is still in the  
8 document that will be posted at Step 2. So what  
9 you need to is, when that document is posted, if  
10 you have comments on that specific section, just  
11 make sure that you send them in to the docket for  
12 discussion at the next phase.

13 MR. PARKER: Okay. A second general  
14 question is can outside persons attend the Brussels  
15 meeting? Is this a closed meeting or is it open to  
16 the public.

17 MS. MOLZON: Your representative will be  
18 the PhRMA representatives on the committee. So, if  
19 you have concerns, you should work with your PhRMA  
20 representative. But it is a closed meeting. It is  
21 just open to the ICH partners, so it would be  
22 PhRMA--Christelle showed the chart of who is  
23 involved, so it will be PhRMA and FDA for the U.S.,  
24 EFPIA and the EU for Europe and then JPMA and MHLW  
25 for Japan.

1           Your representative will be the PhRMA  
2 person on the committee. So, if you have concerns  
3 about this specific issue, you should get in touch  
4 with the PhRMA rep on the committee and then they  
5 can relay these concerns to the expert working  
6 group.

7           MS. SHOWALTER: Let me just further  
8 comment on that. You actually have the possibility  
9 of conferring with the PhRMA, which is the U.S.  
10 industry rep, but also with the EFPIA  
11 representative as well, which would be the European  
12 industry rep, so you would have more than a single  
13 opportunity to talk to your industry  
14 representation.

15           I think that the names of those  
16 representatives should be listed on the ICH  
17 website. I think we have a list of all of the  
18 experts for the various expert working groups. So  
19 you will see who that person is and you will be  
20 able to contact them that way.

21           Thank you, Justina.

22           Dr. Paul Seligman is with us now and he is  
23 going to provide the update on the other  
24 pharmacovigilance topic which is E2E,  
25 Pharmacovigilance Planning.

1                   **E2E: Pharmacovigilance Planning**

2                   MR. SELIGMAN: Good afternoon. The  
3 Pharmacovigilance Planning Group or E2E is one of  
4 the newest topics being considered by  
5 representatives at the ICH. The interest in and  
6 genesis of this topic comes primarily out of  
7 Japan's recent regulation requiring early  
8 postmarket pharmacovigilance, or EPPV, for newly  
9 marketed products in that country.

10                  Dr. Yusuki Tanagawara from KO University  
11 who represents the Japanese Ministry of Health,  
12 Labor and Welfare is the co-lead of this new  
13 working group along with Dr. Peter Arlette from  
14 what was formerly known as the British Medicine's  
15 Control Agency.

16                  Myself, along with Dr. Robert Ball and,  
17 most recently, Dr. Miles Braun from CBER have  
18 represented the FDA on this working group. The  
19 question basically before the E2E Working Group is  
20 that, beyond the current harmonized regulatory  
21 requirements for submitting reports of adverse drug  
22 events, should there be international agreement and  
23 a common understanding regarding additional  
24 surveillance data to be collected and/or studies to  
25 be conducted in the post-marketing period and, if

1 so, should the sponsor of the product submit a plan  
2 to be reviewed by regulatory authorities prior to  
3 the approval or licensing of the product that  
4 describes essentially these additional studies or  
5 additional surveillance; hence pharmacovigilance  
6 planning.

7           The basic premise of this planned  
8 pharmacovigilance approach is that it offers the  
9 opportunity to reduce risk and increase benefit of  
10 medicines to the public of marketed products. The  
11 scope of the guideline as it is currently outlined  
12 is essentially to provide guidance to industry in  
13 the preparation of a pharmacovigilance plan prior  
14 to the launch of a product.

15           It focuses primarily on new drugs,  
16 biologics, new formulations and any new  
17 indications. It is essentially meant to lay out a  
18 pharmacovigilance specification which essentially  
19 is the risk basis or safety basis for developing  
20 the plan. It describes the initial content or  
21 elements of such a plan and it also talks about the  
22 types of postapproval studies that may be utilized  
23 to examine a particular safety question postmarket.

24           This effort has many similarities to FDA's  
25 current effort to develop guidance on good

1 pharmacovigilance practice and postmarketing risk  
2 assessment. Some of you may be familiar with the  
3 public meeting we had last April 9, 10 and 11 here  
4 in Washington and the concept paper which is  
5 currently on the website which is serving as the  
6 basis for the draft guidance that will be provided  
7 by the FDA in the fall as part of our PDUFA-3  
8 agreement.

9           As these two efforts move forward in  
10 tandem, the ICH thinking has been shared with the  
11 drafters of FDA guidance and vice versa, so we want  
12 to make sure that our guidance development is well  
13 harmonized with ICH. This ICH document, I think,  
14 is probably best described as in its earliest  
15 phases of development.

16           That is really all I have to say. I am  
17 happy to field any questions about E2E or what this  
18 pharmacovigilance planning group is up to.

19           MR. MILLER: Loren Miller, PPD. Is this  
20 guidance set up to establish a safety marketing  
21 plan prior to launch that is kind of sequential  
22 plan; that is, you are ready to evaluate safety in  
23 a very short period of time, let's say, after your  
24 product is launched. Are you required to collect  
25 data at earlier time points than you normally would

1 by current regulations? What is the thrust of it?  
2 Is it just a planning document, per se?

3 MR. SELIGMAN: Essentially, it is a  
4 planning document. In the PDUFA-3 agreement and  
5 the goals letter, they talk about more either  
6 intense or concerted surveillance for the first two  
7 to three years postmarketing. I think this  
8 pharmacovigilance planning essentially is going to  
9 parallel that although, in the ICH document, they  
10 have not gotten down to that sort of level of  
11 specificity yet.

12 I think it is primarily focused on that  
13 sort of early period of time following the  
14 introduction of new product.

15 Any other comments or questions? I feel  
16 like I have just zoomed in and zoomed out.

17 MS. SHOWALTER: There don't seem to be  
18 any. So, thank you.

19 MR. SELIGMAN: As I say, there are PhRMA  
20 representatives on the committee; Linda Hoselly and  
21 Janice Bush and Waiju Dai. They are the three who  
22 have served to represent PhRMA's interest in the  
23 early development of this paper.

24 MS. SHOWALTER: Thank you.

25 I want to adjourn the meeting. I thank

1 everyone for their participation and your  
2 indulgence with our bending the agenda a little bit  
3 to try to accommodate everybody. I know we have  
4 run long today but these meetings are very valuable  
5 to us and we will continue doing prior to each ICH  
6 meeting. So we really appreciate your  
7 participation.

8 We also always welcome outside speakers.  
9 We are very thankful that we had one today and we  
10 would hope to more of that in the future.

11 The transcript will be made available on  
12 the web. Again, I just want to thank everyone  
13 including our speakers for their time today. I  
14 know it is difficult getting ready for this meeting  
15 to take time out of the schedules, but, again, we  
16 think it is very valuable.

17 So thank you and we adjourn the meeting.

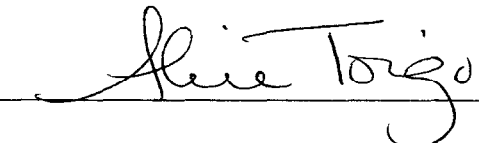

18 [Whereupon, at 12:50 p.m., the meeting was  
19 adjourned.]

20
